

**NAME**

showtwo – Show unfiltered matches between two images

**SYNOPSIS**

**showtwo.exe** *keyfile1[.gz] keyfile2[.gz] [bestCount]*

**DESCRIPTION**

Show unfiltered matches between two images. Both keypoint files are read and matched. The matching does not use postprocessing filtering but displays the matching output directly.

**OPTIONS**

keyfile1[.gz]

keyfile2[.gz]

The filename of the keypoint files. When ".gz" is appended, the file is decompressed using **gzip**(1).

bestCount

An optional integer number. If there are more than this number of matches, only the best matches are kept and no more than the given number of matches is displayed.

**BUGS**

No bugs known, if you find any, please send a bug report to me. I will try to fix it.
