**NAME**

      allcm – force the most important Computer–Modern–fonts to be calculated

**SYNOPSIS**

      **allcm [-r]**

**DESCRIPTION**

      *allcm* forces a large number of Computer Modern Fonts to be calculated as pixel files. This is done through running *dvips*(1) over a certain test-file. Therefore, the fonts are created in the resolution needed by dvips.

      If the –r flag is specified, the command *dvired*(1) will be used instead of dvips.

      *allcm* does not recalculate existing fonts (as long as the Metafont mode does not change).

**SEE ALSO**

      allec(1), allneeded(1), dvips(1), dvired(1).
