Index	123

1 Introduction

The `glossaries` package is provided to assist generating glossaries. It has a certain amount of flexibility, allowing the user to customize the format of the glossary and define multiple glossaries. It also supports acronyms and glossary styles that include symbols (in addition to a name and description) for glossary entries. There is provision for loading a database of glossary terms where only those terms used in the text are added to the glossary. This package replaces the `glossary` package which is now obsolete.

This documentation is structured as follows: [section 2](#) is for people who want a few quick pointers of how to get started, without having to read through lengthy descriptions, [section 3](#) gives an overview of available commands and their syntax, [section 4](#) describes the associated `mfirstruc` package, [section 5](#) contains the documented source code for those who want to know more about how the package works and [section 6](#) contains the documented code for the `mfirstruc` package.

1.1 Multi-Lingual Support

As from version 1.08, the `glossaries` package now has limited multi-lingual support, thanks to all the people who have sent me the relevant translations either via email or via `comp.text.tex`. However you must load `babel` *before* `glossaries` to enable this. Note that if `babel` is loaded and the `translator` package is detected on T_EX's path, then the `translator` package will be loaded automatically, however, it may not pick up on the required languages, so if the predefined text is not translated, you may need to explicitly load the `translator` package with the required languages. For example:

```
\usepackage[spanish]{babel}
\usepackage[spanish]{translator}
\usepackage{glossaries}
```

If you want to use `ngerman` or `german` instead of `babel`, you will need to include the `translator` package to provide the translations. For example:

```
\documentclass[ngerman]{article}
\usepackage{ngerman}
\usepackage{translator}
\usepackage{glossaries}
```

The following languages are currently supported:

Language	As from version
Danish	1.08
Dutch	1.08
English	1.08
French	1.08
German	1.08
Irish	1.08
Italian	1.08
Hungarian	1.08
Polish	1.13
Spanish	1.08

Table 1: Customised Text

Command Name	Translator key word	What it's for
\glossaryname	Glossary	Title of the main glossary.
\acronymname	Acronyms	Title of the list of acronyms (when used with package option <code>acronym</code>).
\entryname	Notation (glossaries)	Header for first column in glossary (for 2, 3 or 4 column glossaries that support headers).
\descriptionname	Description (glossaries)	Header for second column in glossary (for 2, 3 or 4 column glossaries that support headers).
\symbolname	Symbol (glossaries)	Header for symbol column in glossary for glossary styles that support this option.
\pagelistname	Page List (glossaries)	Header for page list column in glossary for glossaries that support this option.
\glssymbolsgroupname	Symbols (glossaries)	Header for symbols section of the glossary for glossary styles that support this option.
\glsnumbersgroupname	Numbers (glossaries)	Header for numbers section of the glossary for glossary styles that support this option.

The language dependent commands and translator keys used by the glossaries package are listed in [table 1](#).

Due to the varied nature of glossaries, it's likely that the predefined translations may not be appropriate. If you are using the `babel` package and do not have the `translator` package installed, you need to be familiar with the advice given in <http://www.tex.ac.uk/cgi-bin/texfaq2html?label=latextwod>.

If you have the `translator` package installed, then it becomes much easier to change the default translations. For example, if you are writing in Irish and you want `\symbolname` to produce “Siombail” instead of “Comhartha”, then you can put the following in your document preamble:

```
\deftranslation[to=Irish]{Symbol (glossaries)}{Siombail}
```

1.2 Generating the associated glossary files

The `glossaries` package comes with the Perl script `makeglossaries` which will run `makeindex` on all the glossary files using a customized `makeindex.ist` style file (which is created by `\makeglossaries`). The relevant extensions are obtained from the auxiliary file, so you should only pass the basename as the argument. For example, if your document is called `myfile.tex`, do:

```
latex myfile  
makeglossaries myfile  
latex myfile
```

You may need to explicitly load `makeglossaries` into Perl:

```
perl makeglossaries myfile
```

There is a batch file called `makeglossaries.bat` which does this for Windows users, but you must have Perl installed to be able to use it.

If you don't have Perl installed, you will have to run `makeindex` for each glossary type you have defined. For example, if you have used the `acronym` package option then you will have both a main glossary as well as a list of acronyms, so you will need to do (assuming your document is called `myfile.tex`):

```
makeindex -s myfile.ist -t myfile.glg -o myfile.gls myfile.glo  
makeindex -s myfile.ist -t myfile.alg -o myfile.acr myfile.acn
```

This requires remembering all extensions for each of the glossaries defined in your document, so where possible you should use `makeglossaries` instead to reduce the possibility of error. Don't pass all the glossary files in a single call to `makeindex` or it will merge all your glossaries into a single glossary.

If any problems occur, remember to check the transcript files (e.g. `.glg` or `.alg`) for messages.

1.3 Troubleshooting

The `glossaries` package comes with a minimal file called `minimalgls.tex` which can be used for testing. This should be located in `texmf/doc/latex/glossaries/samples/`. Further information on debugging L^AT_EX code is available at <http://theoval.cmp.uea.ac.uk/~nlct/latex/minexample/>.

Below is a list of the most frequently asked questions. For other queries, consult the `glossaries` FAQ at <http://theoval.cmp.uea.ac.uk/~nlct/latex/packages/faq/glossariesfaq.html>.

1. I've used the `smallcaps` option, but the acronyms are displayed in normal sized upper case letters.

The `smallcaps` package option uses `\textsc` to typeset the acronyms. This command converts lower case letters to small capitals, while upper case letters remain their usual size. Therefore you need to specify the acronym in lower case letters.

2. How do I change the font that the acronyms are displayed in?

The easiest way to do this is to specify the `smaller` package option and redefine `\acronymfont` to use the required typesetting command. For example, suppose you would like the acronyms displayed in a sans-serif font, then you can do:

```
\usepackage[smaller]{glossaries}
\renewcommand*\acronymfont[1]{\textsf{\#1}}
```

3. How do I change the font that the acronyms are displayed in on first use?

The easiest way to do this is to specify the `smaller` package option and redefine `\firstacronymfont` to use the required command. Note that if you don't want the acronym on subsequent use to use `\smaller`, you will also need to redefine `\acronymfont`, as above. For example to make the acronym emphasized on first use, but use the surrounding font for subsequent use, you can do:

```
\usepackage[smaller]{glossaries}
\renewcommand*\firstacronymfont[1]{\emph{\#1}}
\renewcommand*\acronymfont[1]{\#1}
```

4. I don't have Perl installed, do I have to use `makerglossaries`?

Read [subsection 1.2](#).

5. I'm used to using the `glossary` package: are there any instructions on migrating from the `glossary` package to the `glossaries` package?

Read the file `glossary2glossaries.pdf` which should be available from the same location as this document.

6. I'm using `babel` but the fixed names haven't been translated.

The `glossaries` package currently only supports the following languages: Danish, Dutch, English, French, German, Irish, Italian, Hungarian, Polish and Spanish. If you want to add another language, send me the translations, and I'll add them to the next version.

If you are using one of the above languages, but the text hasn't been translated, try adding the `translator` package with the required languages explicitly (before you load the `glossaries` package). For example:

```
\usepackage[ngerman]{babel}
\usepackage[ngerman]{translator}
\usepackage{glossaries}
```

Alternatively, you may be able to add the language as a global option to the class file. Check the `translator` package documentation for further details.

7. My glossaries haven't appeared.

Remember to do the following:

- Add `\makeglossaries` to the document preamble.
- Use either `\printglossary` for each glossary that has been defined or `\printglossaries`.
- Use `\gls`, `\Gls`, `\GLS`, `\glspl`, `\Glspl`, `\GLSpl`, `\glslink`, `\glsadd` or `\glsaddall` in the document.
- Run `LATEX` on your document, then run `makeglossaries`, then run `LATEX` on your document again. If you want the glossaries to appear in the table of contents, you will need an extra `LATEX` run.

2 A Quick Guide For The Impatient

This section is for people who want a few quick pointers of how to get started. However it is recommended that you read [section 3](#) for additional commands and advice not listed here.

1. Load glossaries *after* hyperref:

```
\usepackage{hyperref}
\usepackage{glossaries}
```

Similarly for the `html` package:

```
\usepackage{html}
\usepackage{glossaries}
```

2. Always use `\makeglossaries` if you want the glossary entries to be written to the glossary file:

```
\documentclass{article}
\usepackage{glossaries}
\makeglossaries
```

If you don't use `\makeglossaries`, your glossaries will not appear in the document!

3. Use `\printglossaries` to make your glossaries appear in the document at that point. For example:

```
\maketitle
\printglossaries
\section{Introduction}
```

Note that only the glossary entries that have been used in the document text will appear in the glossary.

- When you have created your document, run L^AT_EX on it, then the Perl script `makeglossaries`, then run L^AT_EX on it again:

```
latex myfile
makeglossaries myfile
latex myfile
```

(You may need to run L^AT_EX again if you have used the `toc` package option.) If you use Windows, there is a batch file called `makeglossaries.bat` which you can use, but you will still need Perl installed.

- New glossaries can be defined using:

```
\newglossary[⟨log-ext⟩]{⟨label⟩}{⟨in-ext⟩}{⟨out-ext⟩}{⟨title⟩}
```

where `⟨label⟩` is an identifying label, `⟨in-ext⟩` is the extension of the file to be created by `makeindex` (called by `makeglossaries`), `⟨out-ext⟩` is the extension of the file to be read by `makeindex` and `⟨title⟩` is the title for this new glossary. The first optional argument `⟨log-ext⟩` specifies the extension of the `makeindex` transcript file. Example:

```
\newglossary[nlg]{notation}{not}{ntn}{Notation}
```

This glossary's label is `notation` and its title will be `Notation`. If you use `makeglossaries`, the `makeindex` transcript will be written to a file with the extension `.nlg`. If `⟨log-ext⟩` is omitted, the extension `.glg` will be used.

- Any new glossaries must be defined before `\makeglossaries`

```
\documentclass{article}
\usepackage{glossaries}
\newglossary{notation}{not}{ntn}{Notation}
\makeglossaries
```

- If you use the `acronym` package option, the `glossaries` package will automatically create a new glossary type labelled `acronym`:

```
\usepackage[acronym]{glossaries}
```

- If your pages have a hyphen compositor (i.e. your page numbers appear in the form 2-1), redefine `\glscompositor` before `\makeglossaries`:

```
\documentclass{article}
\usepackage{glossaries}
\renewcommand{\glscompositor}{-}
\makeglossaries
```

- To add the glossaries to the table of contents use the `toc` package option:

```
\usepackage[toc]{glossaries}
```

10. Define a new entry with:

```
\newglossaryentry{\langle label \rangle}{\langle key-val list \rangle}
```

The *key-val list* must at least contain a `name` key and a `description` key. For example:

```
\newglossaryentry{perl}{name=Perl,  
description=A scripting language}
```

In this example, I have given the entry the label `perl`. Whenever I want to use this entry, that is the label I need to use to identify it.

11. If the entry name starts with an accented letter, you will need to group the first letter (otherwise it will cause a problem for `\Gls` and `\Glspl`):

```
\newglossaryentry{elite}{name={{\'e}lite},  
description={select group or class}}
```

Likewise with commands such as `\ae` and `\oe`:

```
\newglossaryentry{oesophagus}{%  
name={{\oe}sophagus},  
description={canal from mouth to stomach}}
```

12. If you have multiple glossaries, use the `type` key to specify in which glossary the entry belongs. For example:

```
\newglossary{languages}{lan}{lng}{Index of Languages}
```

```
\makeglossaries
```

```
\newglossaryentry{perl}{name=Perl,  
description=A scripting language,  
type=languages}
```

If `type` is omitted, the default glossary is used.

13. Remember to group values that have a comma or equal sign. For example:

```
\newglossaryentry{pagelist}{name=page list,  
description={A list of individual pages or page ranges  
(e.g.\ 1,2,4,7--9)}}
```

14. Plural forms are assumed to be the singular form with an “s” appended, unless otherwise specified. To specify an irregular plural, use the `plural` key. For example:

```
\newglossaryentry{matrix}{name=matrix,  
description=rectangular array of quantities,  
plural=matrices}
```

15. The way the term appears in the main text can be different from the way the term appears in the glossary:

```
\newglossaryentry{matrix}{name=Matrix,
description=rectangular array of quantities,
text=matrix,
plural=matrices}
```

In this example, the entry name appears as “Matrix” in the glossary, and either “matrix” or “matrices” in the text.

16. The way the term appears on first use can be different to the way it appears subsequently:

```
\newglossaryentry{singmtx}{name=Singular Matrix,
description=A matrix with a zero determinant,
first=singular matrix (SM),
text=SM,
firstplural=singular matrices (SMs)}
```

In this example, the entry name appears as “Singular Matrix” in the glossary, and in the text it appears as “singular matrix (SM)” or “singular matrices (SMs)” the first time the entry is used, and subsequently appears as “SM” or “SMs”.

17. The quick and easy way to define an acronym is to use:

```
\newacronym[<key-val list>]{<label>}{<abbrev>}{<long>}
```

For example:

```
\newacronym{svm}{SVM}{support vector machine}
```

This is equivalent to:

```
\newglossaryentry{svm}{type=\acronymtype,
name={SVM},
description={support vector machine},
text={SVM},
first={support vector machine (SVM)},
plural={SVMs},
firstplural={support vector machines (SVMs)})
```

(The value of `\acronymtype` varies depending on whether the `acronym` package option is used or not. The optional argument `<key-val list>` can be used to override any of the `\newglossaryentry` keys; for example, if the acronym has an irregular plural.)

18. The font used to display the entry name in the glossary is governed by `\glsnamefont`. This can be redefined as required. For example, to make the entry names appear in a medium sans-serif font do:

```
\renewcommand{\glsnamefont}[1]{\textsf{\mdseries #1}}
```

Note that the list-like glossary styles defined in the `glossary-list` package place the entry name in the optional argument to `\item`, so they will appear in bold, unless you redefine `\glsnamefont` to counteract the bold font.

19. In the document use `\gls{<label>}` to use a predefined term (this will also enter the term into the associated glossary output file). For example:

```
A \gls{singmtx} is a matrix with a zero determinant.
```

20. Other variations:

- `\Gls{<label>}` : like `\gls`, but with first letter in upper case
- `\GLS{<label>}` : like `\gls`, but all upper case.
- `\glspl{<label>}` : use plural
- `\Glspl{<label>}` : use plural with first letter in upper case
- `\GLSpl{<label>}` : use plural but all upper case
- `\glslink{<label>}{<link text>}` : use `<link text>` to link to the given entry in the glossary.

For example, the following will produce the plural form with the first letter in uppercase:

```
\Glspl{singmtx} are matrices with a zero determinant.
```

21. Additional text can be appended to the link using the `end` optional argument. For example, to form the possessive:

```
The \gls{singmtx}[']s dimensions \ldots
```

22. The format of the associated entry number can be changed using the `format` key in the optional argument. Note that the value of the `format` key should be the name of a command *without* the initial backslash. For example:

```
The primary definition of \glspl[format=textbf]{singmtx}.
```

In this example the relevant glossary entry will have the page number in bold (since it uses `\textbf`) but it will no longer have a hyperlink (if hyperlinks are enabled.)

23. The `glossaries` package provides commands to change the font whilst ensuring that the number remains a hyperlink. These are of the form `\hyper{xx}` and are equivalent to the standard font changing commands of the form `\text{xx}`, as well as `\hyperemph` (which uses `\emph`.) For example:

```
The primary definition of \glspl[format=hyperbf]{singmtx}.
```

24. Don't use declarations in `format` as this can cause unpredictable results, as there is no guarantee that the effect will be localised to the required text.

25. Entries can be added to the glossary without producing any text using `\glsadd{<label>}` or `\glsaddall`. These commands also take an optional argument where you can specify the format. For example

```
\glsadd[format=hyperbf]{singmtx}
```

will add a line to the glossary file for the specified term, but will not produce any text where the command occurs.

26. A number range can be entered using `format=(` and `format=)` to mark the beginning and ending of the range¹. For example:

```
\glsadd[format=()]{singmtx}
This is a very long section all about \glspl{singmtx}.

% lots of text omitted

\glsadd[format=()]{singmtx}
```

This is equivalent to `makeindex`'s `|(`` and `)`` formats.

27. You can combine the range markers with a formatting command (again without the preceding backslash). For example:

```
This is the start of a very long section all
about \glspl[format=(hyperbf)]{singmtx}.

% lots of text omitted

This is the end a very long section all about
\glspl[format=)hyperbf]{singmtx}.
```

28. Only those terms that have actually been used in the document will be placed in the glossary. If you have defined a term that doesn't appear in the document, then it means you haven't used it in the text (either via `\glslink` or `\gls` and related commands, or via `\glsadd` or `\glsaddall`.)

29. To change the sorting order, use the `sort` key. For example:

```
\newglossaryentry{universal}{name={\ensuremath{\mathcal{U}}}},
description=The universal set,
sort=U}
```

30. You don't need to escape `makeindex`'s special characters:

```
\newglossaryentry{quote}{name={"},
description={Double quote character}}

\newglossaryentry{exclam}{name={!},
description={Exclamation mark}}

\newacronym{rna}{RNA}{ribonukleins\"aure}
```

¹This is new to version 1.01

31. Associated symbols can also be specified, but whether the symbol appears in the glossary depends on the glossary style. For example:

```
\newglossaryentry{metre}{name={metre},  
description={A metric measurement of length},  
symbol={m}}
```

The predefined glossary styles that display the entry symbol are: `long4col`, `long4colheader`, `long4colborder`, `long4colheaderborder`, `super4col`, `super4colheader`, `super4colborder` and `super4colheaderborder`. All the other styles supplied by this package ignore the associated symbol.

32. Glossary styles can be set using the `style` package option. For example:

```
\usepackage[style=long3col]{glossaries}
```

or using `\glossarystyle{<style>}`. For example:

```
\glossarystyle{altlist}
```

The predefined glossary styles provided by the `glossaries` bundle are listed in [subsection 3.10](#).

33. The list of numbers associated with each glossary entry can be suppressed using the package option `nonumberlist`:

```
\usepackage[nonumberlist]{glossaries}
```

34. By default, the `glossaries` will appear in an unnumbered chapter if chapters are defined, otherwise in an unnumbered section. This can be changed using the `section` package option. For example, to make the `glossaries` appear in an unnumbered section, even if chapters are defined, do:

```
\usepackage[section]{glossaries}
```

Other sectional units can also be specified as `section=<value>`. For example, to make the `glossaries` appear in unnumbered subsections:

```
\usepackage[section=subsection]{glossaries}
```

3 Overview

3.1 Package Options

The `glossaries` package options are as follows:

toc Add the `glossaries` to the table of contents.

numberline When used with `toc`, this will add `\numberline{}` in the final argument of `\addcontentsline`. This will align the table of contents entry with the numbered section titles. Note that this option has no effect if the `toc` option is omitted. If `toc` is used without `numberline`, the title will be aligned with the section numbers rather than the section titles.

acronym Make a separate glossary for acronyms.

section This is a $\langle key \rangle = \langle value \rangle$ option. Its value should be the name of a sectional unit (e.g. chapter). This will make the glossaries appear in the named sectional unit, otherwise each glossary will appear in a chapter, if chapters exists, otherwise in a section. Unnumbered sectional units will be used by default. Example:

```
\usepackage[section=subsection]{glossaries}
```

You can omit the value if you want to use sections, i.e.

```
\usepackage[section]{glossaries}
```

is equivalent to

```
\usepackage[section=section]{glossaries}
```

You can change this value later in the document using `\setglossarysection{(type)}`.

numberedsection The glossaries are placed in unnumbered sectional units by default, but this can be changed using `numberedsection`. This option can take three possible values: `false` (no number, i.e. use starred form), `nolabel` (numbered, i.e. unstarred form, but not labelled) and `autolabel` (numbered with automatic labelling). If `numberedsection=autolabel` is used, each glossary is given a label that matches the glossary type, so the main (default) glossary is labelled `main`, the list of acronyms is labelled `acronym`² and additional glossaries are labelled using the value specified in the first mandatory argument to `\newglossary`. For example, if you load `glossaries` using:

```
\usepackage[section, numberedsection=autolabel]{glossaries}
```

then each glossary will appear in a numbered section, and can be referenced using something like:

```
The main glossary is in section~\ref{main} and the list of acronyms is in section~\ref{acronym}.
```

If you can't decide whether to have the acronyms in the main glossary or a separate list of acronyms, you can use `\acronymtype` which is set to `main` if the `acronym` option is not used and is set to `acronym` if the `acronym` option is used. For example:

```
The list of acronyms is in section~\ref{\acronymtype}.
```

As from version 1.14, you can add a prefix to the label by redefining `\glsautoprefix`. For example:

```
\renewcommand*\glsautoprefix{glo:}
```

²if the `acronym` option is used, otherwise the list of acronyms is the main glossary

will add `glo:` to the automatically generated label, so you can then, for example, refer to the list of acronyms as follows:

```
The list of acronyms is in section~\ref{glo:\acronymtype}.
```

Or, if you are undecided on a prefix:

```
The list of acronyms is in section~\ref{\glsautoprefix\acronymtype}.
```

style This is a `<key>=<value>` option. Its value should be the name of the glossary style to use. Predefined glossary styles are listed in [subsection 3.10](#).

nonumberlist This option will suppress the associated number lists in the glossaries (see also [subsection 3.3](#).)

counter This is a `<key>=<value>` option. The value should be the name of the default counter to use in the number lists.

sanitize This is a `<key>=<value>` option whose value is also a `<key>=<value>` list. By default, the `glossaries` package sanitizes the values of the `name`, `description` and `symbol` keys used when defining a new glossary entry. This may lead to unexpected results if you try to display these values within the document text. This sanitization can be switched off using the `sanitize` package option. (See [subsection 5.2](#) and [subsection 5.6](#) for further details.) For example, to switch off the sanitization for the `description` and `name` keys, but not for the `symbol` key, do:

```
\usepackage[sanitize={name=false,description=false,%
symbol=true}]{glossaries}
```

Note: this sanitization only applies to the `name`, `description` and `symbol` keys. It doesn't apply to any of the other keys (except the `sort` key which is always sanitized) so fragile commands contained in the value of the other keys must always be protected using `\protect`. Since the value of the `text` key is obtained from the `name` key, you will still need to protect fragile commands in the `name` key if you don't use the `text` key.

description This option changes the definition of `\newacronym` to allow a description. See [subsection 3.8](#) for further details.

footnote This option changes the definition of `\newacronym` and the way that acronyms are displayed. See [subsection 3.8](#) for further details.

smallcaps This option changes the definition of `\newacronym` and the way that acronyms are displayed. See [subsection 3.8](#) for further details.

smaller This option changes the definition of `\newacronym` and the way that acronyms are displayed. See [subsection 3.8](#) for further details.

dua This option changes the definition of `\newacronym` so that acronyms are always expanded. See [subsection 3.8](#) for further details.

shortcuts This option provides shortcut commands for acronyms. See [subsection 3.8](#) for further details.

3.2 Defining Glossary Entries

All glossary entries must be defined before they are used, so it is better to define them in the preamble to ensure this.³ However only those entries that occur in the document (using any of the commands described in subsection 3.4 and subsection 3.5) will appear in the glossary. Each time an entry is used in this way, a line is added to an associated glossary (.glo) file, which then needs to be converted into a corresponding .gls file which contains the typeset glossary which is input by \printglossary or \printglossaries. The Perl script makeglossaries can be used to call makeindex, using a customised .ist style file, for each of the glossaries that are defined in the document. Note that there should be no need for you to explicitly edit or input any of these external files.

\makeglossaries

\glscompositor

\newglossaryentry

The command \makeglossaries must be placed in the preamble in order to create the customised makeindex .ist style file and to ensure that glossary entries are written to the appropriate output file. If you omit \makeglossaries none of the glossaries will be created. Note that if your page numbers use a hyphen compositor, you must set this by redefining \glscompositor *before* using \makeglossaries:

```
\renewcommand*{\glscompositor}{-}
```

(The default value of \glscompositor is a full stop.)

New glossary entries are defined using the command:

```
\newglossaryentry{\langle label \rangle}{\langle key-val list \rangle}
```

The first argument, *<label>*, must be a unique label with which to identify this entry. The second argument, *<key-val list>*, is a *<key>=<value>* list that supplies the relevant information about this entry. There are two required fields: name and description. Available fields are listed below:

name The name of the entry (as it will appear in the glossary).

description A brief description of this term (to appear in the glossary).

descriptionplural The plural form of the description (as passed to \glsdisplay and \glsdisplayfirst by \glsp{1}, \Gls{1} and \GLS{1}). If omitted, the value is set to the same as the description key.

text How this entry will appear in the document text when using \gls (or one of its uppercase variants). If this field is omitted, the value of the name key is used.

first How the entry will appear in the document text the first time it is used with \gls (or one of its uppercase variants). If this field is omitted, the value of the text key is used.

plural How the entry will appear in the document text when using \glsp{1} (or one of its uppercase variants). If this field is omitted, the value is obtained by appending \glspluralsuffix to the value of the text field.

³The only preamble restriction on \newglossaryentry and \newacronym was removed in version 1.13, but the restriction remains for \loadglsentries.

firstplural How the entry will appear in the document text the first time it is used with `\glsp{1}` (or one of its uppercase variants). If this field is omitted, the value is obtained from the `plural` key, if the `first` key is omitted, or by appending `\glspluralsuffix` to the value of the `first` field, if the `first` field is present.

Note: prior to version 1.13, the default value of `firstplural` was always taken by appending “`s`” to the `first` key, which meant that you had to specify both `plural` and `firstplural`, even if you hadn’t used the `first` key.

symbol This field is provided to allow the user to specify an associated symbol, but most glossary styles ignore this value. If omitted, the value is set to `\relax`.

symbolplural This is the plural form of the symbol (as passed to `\glsdisplay` and `\glsdisplayfirst` by `\glsp{1}`, `\Gls{1}` and `\GLS{1}`). If omitted, the value is set to the same as the `symbol` key.

sort This value indicates how `makeindex` should sort this entry. If omitted, the value is given by the `name` field. This value is equivalent to `makeindex`’s “actual” character (which is usually the at-sign @ although the `glossaries` package uses a different symbol).

type This is the glossary type to which this entry belongs. If omitted, the default glossary is assumed. The list of acronyms type is given by `\acronymtype` which will either be `main` or `acronym`, depending on whether the `acronym` package option was used.

Note that if the key starts with an accented letter, you must group the accented letter, otherwise it will cause a problem for commands like `\Gls` and `\Glsp{1}`. For example:

```
\newglossaryentry{elite}{name={{\'e}lite},  
description={select group or class}}
```

3.2.1 Plurals

You may have noticed from above that you can specify the plural form when you define a term. If you omit this, the plural will be obtained by appending `\glspluralsuffix` to the singular form. This command defaults to `s`. For example:

```
\newglossaryentry{cow}{name=cow,description=a fully grown  
female of any bovine animal}
```

defines a new entry whose singular form is “cow” and plural form is “cows”. However, if you are writing in archaic English, you may want to use “kine” as the plural form, in which case you would have to do:

```
\newglossaryentry{cow}{name=cow,plural=kine,  
description=a fully grown female of any bovine animal}
```

If you are writing in a language that supports multiple plurals (for a given term) then use the `plural` key for one of them (typically the one you are most likely to use) and for the others you will need to explicitly write the plural form

using `\glslink` rather than using `\glspl`. Returning to the cow example above, suppose you will mostly be using “cows” as the plural, but occasionally you want to use “kine” as the plural, then define the term as

```
\newglossaryentry{cow}{name=cow,description={a fully grown  
female of any bovine animal (plural cows, archaic plural kine)}}
```

and use `\glspl{cow}` to produce “cows” and use `\glslink{cow}{kine}` to produce “kine”.

If you are using a language that usually forms plurals by appending a different letter, or sequence of letters, you can redefine `\glspluralsuffix` as required. However, this must be done *before* the entries are defined. For languages that don’t form plurals by simply appending a suffix, all the plural forms must be specified using the `plural` key (and the `firstplural` key where necessary).

3.2.2 Loading Entries From a File

`\loadglsentries` You can store all your glossary entry definitions in another file, and use:

```
\loadglsentries[<type>]{<filename>}
```

where `<filename>` is the name of the file containing all the `\newglossaryentry` commands. The optional argument `<type>` is the name of the glossary to which those entries should belong, for those entries where the `type` key has been omitted (or, more specifically, for those entries whose type has been specified by `\glsdefaulttype`, which is what `\newglossaryentry` uses by default). For example, suppose I have a file called `myentries.tex` which contains:

```
\newglossaryentry{perl}{type=main,  
name={Perl},  
description={A scripting language}}  
  
\newglossaryentry{tex}{name={\TeX},  
description={A typesetting language}}  
  
\newglossaryentry{html}{type=\glsdefaulttype,  
name={html},  
description={A mark up language}}
```

and suppose in my document preamble I use the command:

```
\loadglsentries[languages]{myentries}
```

then this will add the entries `tex` and `html` to the glossary whose type is given by `languages`, but the entry `perl` will be added to the main glossary, since it explicitly sets the type to `main`.

Note: if you use `\newacronym` (see subsection 3.8) the type is set as `type=\acronymtype` unless you explicitly override it. For example, if my file `myacronyms.tex` contains:

```
\newacronym{aca}{aca}{a contrived acronym}
```

then (supposing I have defined a new glossary type called `altacronym`)

```
\loadglsentries[altacronym]{myacronyms}
```

will add `aca` to the glossary type `acronym`, if the package option `acronym` has been specified, or will add `aca` to the glossary type `altacronym`, if the package option `acronym` is not specified. In this instance, it is better to change `myacronyms.tex` to:

```
\newacronym[type=\glsdefaulttype]{aca}{aca}{a contrived acronym}
```

and now

```
\loadglsentries[altacronym]{myacronyms}
```

will add `aca` to the glossary type `altacronym`, regardless of whether or not the package option `acronym` is used.

Note that only those entries that have been used in the text will appear in the relevant glossaries. Note also that `\loadglsentries` may only be used in the preamble.

3.3 Number lists

Each entry in the glossary has an associated *number list*. By default, these numbers refer to the pages on which that entry has been used (using any of the commands described in subsection 3.4 and subsection 3.5). The number list can be suppressed using the `nonumberlist` package option, or an alternative counter can be set as the default using the `counter` package option.

3.4 Links to Glossary Entries

Once you have defined a glossary entry using `\newglossaryentry`, you can refer to that entry in the document using one of the commands listed in this section. The text which appears at that point in the document when using one of these commands is referred to as the *link text* (even if there are no hyperlinks).

The way the link text is displayed depends on `\glstextformat{<text>}`. For example, to make all link text appear in a sans-serif font, do:

```
\renewcommand*\glstextformat[1]{\textsf{\#1}}
```

`\glslink` The command:

```
\glslink[<options>]{<label>}{<text>}
```

will place `\glstextformat{<text>}` in the document at that point and add a line into the associated glossary file for the glossary entry given by `<label>`. If hyperlinks are supported, `<text>` will be a hyperlink to the relevant line in the glossary. The optional argument `<options>` must be a `<key>=<value>` list which can take any of the following keys:

format This specifies how to format the associated number for this entry in the glossary. This value is equivalent to the `makeindex` encap value, and (as with `\index`) the value needs to be the name of a command *without* the initial backslash. As with `\index`, the characters (and) can also be used to specify the beginning and ending of a number range. Again as with `\index`, the command should be the name of a command which takes an argument (which will be the associated number). Be careful not to use a declaration

(such as `\bfseries`) instead of a text block command (such as `\textbf`) as the effect is not guaranteed to be localised. If you want to apply more than one style to a given entry (e.g. **bold** and *italic*) you will need to create a command that applies both formats, e.g.

```
\newcommand*{\textbfem}[1]{\textbf{\emph{#1}}}
```

and use that command.

If you are using hyperlinks and you want to change the font of the hyperlink, don't use `\hyperpage` (provided by the `hyperref` package) as the numbers may not refer to a page number. Instead, the `glossaries` package provides the following number formats:

<code>hyperrm</code>	The number is a serif hyperlink to the relevant part of the document
<code>hypersf</code>	The number is a sans-serif hyperlink to the relevant part of the document
<code>hypertt</code>	The number is a monospaced hyperlink to the relevant part of the document
<code>hyperbf</code>	The number is a bold hyperlink to the relevant part of the document
<code>hypermd</code>	The number is a medium weight hyperlink to the relevant part of the document
<code>hyperit</code>	The number is an italic hyperlink to the relevant part of the document
<code>hypersl</code>	The number is a slanted hyperlink to the relevant part of the document
<code>hyperup</code>	The number is an upright hyperlink to the relevant part of the document
<code>hypersc</code>	The number is a small caps hyperlink to the relevant part of the document
<code>hyperemph</code>	The number is an emphasized hyperlink to the relevant part of the document

Note that if the `\hyperlink` command hasn't been defined, the `hyper<xx>` formats are equivalent to the analogous `\text<xx>` font commands. If you want to make a new format, you will need to define a command which takes one argument and use that; for example, if you want the associated number in the glossary to be in a bold sans-serif font, you can define a command called, say, `\hyperbsf`:

```
\newcommand{\hyperbsf}[1]{\textbf{\hypersf{#1}}}
```

and then use `hyperbsf` as the value for the `format` key. (See also [subsection 5.13](#).)

counter This specifies which counter to use for the associated number for this glossary entry. (See also [subsection 3.3](#).)

hyper This is a boolean key which can be used to enable/disable the hyperlink to the relevant entry in the glossary. (Note that setting `hyper=true` will

have no effect if `\hyperlink` has not been defined.) The default value is `hyper=true`.

`\glslink*` There is also a starred version:

```
\glslink*[\langle options \rangle]{\langle label \rangle}{\langle text \rangle}
```

which is equivalent to `\glslink`, except it sets `hyper=false`.

`\gls` The command:

```
\gls[\langle options \rangle]{\langle label \rangle}{[\langle insert \rangle]}
```

is the same as `\glslink`, except that the link text is determined from the values of the `text` and `first` keys supplied when the entry was defined using `\newglossaryentry`. If the entry has been marked as having been used, the value of the `text` key will be used, otherwise the value of the `first` key will be used. On completion, `\gls` will mark the entry given by `\langle label \rangle` as used.

There are two uppercase variants:

```
\Gls \Gls[\langle options \rangle]{\langle label \rangle}{[\langle insert \rangle]}
```

and

```
\GLS \GLS[\langle options \rangle]{\langle label \rangle}{[\langle insert \rangle]}
```

which make the first letter of the link or all the link text uppercase, respectively.

The final optional argument `\langle insert \rangle`, allows you to insert some additional text into the link text. By default, this will append `\langle insert \rangle` at the end of the link text, but this can be changed (see [subsubsection 3.4.1](#)).

The first optional argument `\langle options \rangle` is the same as the optional argument to `\glslink`. As with `\glslink`, these commands also have a starred version that disable the hyperlink.

There are also analogous plural forms:

```
\glsp{ \glsp[\langle options \rangle]{\langle label \rangle}{[\langle insert \rangle]}}
```

```
\Glsp{ \Glsp[\langle options \rangle]{\langle label \rangle}{[\langle insert \rangle]}}
```

```
\GLSp{ \GLSp[\langle options \rangle]{\langle label \rangle}{[\langle insert \rangle]}}
```

These determine the link text from the `plural` and `firstplural` keys supplied when the entry was first defined. As before, these commands also have a starred version that disable the hyperlink.

`\glstext` The command:

```
\glstext[\langle options \rangle]{\langle label \rangle}{[\langle insert \rangle]}
```

is similar to `\gls` except that it always uses the value of the `text` key and does not mark the entry as having been used. Unlike `\gls`, the inserted text `\langle insert \rangle` is always appended to the link text.

There are also analogous commands:

```
\Glstext{ \Glstext[\langle options \rangle]{\langle text \rangle}{[\langle insert \rangle]}}
```

```
\GLStext \GLStext[⟨options⟩]{⟨text⟩}{⟨insert⟩}
```

As before, these commands also have a starred version that disable the hyperlink.

\glsfirst The command:

```
\glsfirst[⟨options⟩]{⟨label⟩}{⟨insert⟩}
```

is similar to `\glstext` except that it always uses the value of the `first` key. Again, `⟨insert⟩` is always appended to the end of the link text and does not mark the entry as having been used.

There are also analogous commands:

```
\Glsfirst \Glsfirst[⟨options⟩]{⟨text⟩}{⟨insert⟩}
```

```
\GLSfirst \GLSfirst[⟨options⟩]{⟨text⟩}{⟨insert⟩}
```

As before, these commands also have a starred version that disable the hyperlink.

\glsplural The command:

```
\glsplural[⟨options⟩]{⟨label⟩}{⟨insert⟩}
```

is similar to `\glstext` except that it always uses the value of the `plural` key. Again, `⟨insert⟩` is always appended to the end of the link text and does not mark the entry as having been used.

There are also analogous commands:

```
\Glsplural \Glsplural[⟨options⟩]{⟨text⟩}{⟨insert⟩}
```

```
\GLSplural \GLSplural[⟨options⟩]{⟨text⟩}{⟨insert⟩}
```

As before, these commands also have a starred version that disable the hyperlink.

\glsfirstplural The command:

```
\glsfirstplural[⟨options⟩]{⟨label⟩}{⟨insert⟩}
```

is similar to `\glstext` except that it always uses the value of the `firstplural` key. Again, `⟨insert⟩` is always appended to the end of the link text and does not mark the entry as having been used.

There are also analogous commands:

```
\Glsfirstplural \Glsfirstplural[⟨options⟩]{⟨text⟩}{⟨insert⟩}
```

```
\GLSfirstplural \GLSfirstplural[⟨options⟩]{⟨text⟩}{⟨insert⟩}
```

As before, these commands also have a starred version that disable the hyperlink.

\glsname The command:

```
\glsname[⟨options⟩]{⟨label⟩}{⟨insert⟩}
```

is similar to `\glstext` except that it always uses the value of the `name` key. Again, `⟨insert⟩` is always appended to the end of the link text and does not mark the entry as having been used. Note: if you want to use this command and the `name` key contains commands, you will have to disable the **sanitization** of the `name` key and

protect fragile commands.

There are also analogous commands:

```
\Glsname  \Glsname[⟨options⟩]{⟨text⟩}{⟨insert⟩}  
\GLSname  \GLSname[⟨options⟩]{⟨text⟩}{⟨insert⟩}
```

As before, these commands also have a starred version that disable the hyperlink.

`\glssymbol` The command:

```
\glssymbol[⟨options⟩]{⟨label⟩}{⟨insert⟩}
```

is similar to `\glstext` except that it always uses the value of the `symbol` key. Again, `⟨insert⟩` is always appended to the end of the link text and does not mark the entry as having been used. Note: if you want to use this command and the `symbol` key contains commands, you will have to disable the **sanitization** of the `symbol` key and protect fragile commands.

There are also analogous commands:

```
\Glssymbol  \Glssymbol[⟨options⟩]{⟨text⟩}{⟨insert⟩}  
\GLSsymbol  \GLSsymbol[⟨options⟩]{⟨text⟩}{⟨insert⟩}
```

As before, these commands also have a starred version that disable the hyperlink.

`\glsdesc` The command:

```
\glsdesc[⟨options⟩]{⟨label⟩}{⟨insert⟩}
```

is similar to `\glstext` except that it always uses the value of the `description` key. Again, `⟨insert⟩` is always appended to the end of the link text and does not mark the entry as having been used. Note: if you want to use this command and the `description` key contains commands, you will have to disable the **sanitization** of the `description` key and protect fragile commands.

There are also analogous commands:

```
\Glsdesc  \Glsdesc[⟨options⟩]{⟨text⟩}{⟨insert⟩}  
\GLSdesc  \GLSdesc[⟨options⟩]{⟨text⟩}{⟨insert⟩}
```

As before, these commands also have a starred version that disable the hyperlink.

3.4.1 Changing the format of the link text

The format of the link text for `\gls`, `\glsp` and their uppercase variants is governed by two commands: `\glsdisplayfirst`, which is used the first time a glossary entry is used in the text and `\glsdisplay`, which is used subsequently. Both commands take four arguments: the first is either the singular or plural form given by the `text`, `plural`, `first` or `firstplural` keys (used when the term was defined) depending on context; the second argument is the term's description (as supplied by the `description` key); the third argument is the symbol associated with the term (as supplied by the `symbol` key) and the fourth argument is the additional text supplied in the final optional argument to `\gls` or `\glsp` (or their uppercase

variants). The default definitions of `\glsdisplay` and `\glsdisplayfirst` simply print the first argument immediately followed by the fourth argument. The remaining arguments are ignored.

For example, suppose you want a glossary of measurements and units, you can use the `symbol` key to store the unit:

```
\newglossaryentry{distance}{name=distance,
description={The length between two points},
symbol={km}}
```

and now suppose you want `\gls{distance}` to produce “distance (km)” on first use, then you can redefine `\glsdisplayfirst` as follows:

```
\renewcommand{\glsdisplayfirst}[4]{#1#4 (#3)}
```

Note that the additional text is placed after #1, so `\gls{distance}['s]` will produce “distance's (km)” rather than “distance (km)'s” which looks a bit odd (even though it may be in the context of “the distance (km) is measured between the two points” — but in this instance it may be better not to use a contraction).

Note also that all of the link text will be formatted according to `\glstextformat` (described earlier). So if you do, say:

```
\renewcommand{\glstextformat}[1]{\textbf{#1}}
\renewcommand{\glsdisplayfirst}[4]{#1#4 (#3)}
```

then `\gls{distance}` will produce “**distance (km)**”.

If you have multiple glossaries, changing `\glsdisplayfirst` and `\glsdisplay` will change the way entries for all of the glossaries appear when using commands `\gls`, `\glspl` and their uppercase variants. If you only want the change to affect entries for a given glossary, then you need to use `\defglsdisplay` and `\defglsdisplayfirst` instead of redefining `\glsdisplay` and `\glsdisplayfirst`.

Both `\defglsdisplay` and `\defglsdisplayfirst` take two arguments: the first (which is optional) is the glossary's label⁴ and the second is how the term should be displayed when it is invoked using commands `\gls`, `\glspl` and their uppercase variants. This is similar to the way `\glsdisplayfirst` was redefined above.

For example, suppose you have created a new glossary called `notation` and you want to change the way the entry is displayed on first use so that it includes the symbol, you can do:

```
\defglsdisplayfirst[notation]{#1#4 (denoted #3)}
```

Now suppose you have defined an entry as follows:

```
\newglossaryentry{set}{type=notation,
name=set,
description={A collection of objects},
symbol={$\$\$}
}
```

⁴main for the main (default) glossary, `\acronymtype` for the list of acronyms, or the name supplied in the first mandatory argument to `\newglossary` for additional glossaries.

The first time you reference this entry using `\gls` it will be displayed as: “set (denoted *S*)” (similarly for `\glspl` and the uppercase variants).

Remember that if you use the `symbol` key, you need to use a glossary style that displays the symbol, as many of the styles ignore it. In addition, if you want either the description or symbol to appear in the link text, you will have to disable the `sanitization` of these keys and protect fragile commands.

3.4.2 Enabling and disabling hyperlinks to glossary entries

If you load the `hyperref` or `html` packages prior to loading the `glossaries` package, commands such as `\glslink` and `\gls`, described above, will automatically have hyperlinks to the relevant glossary entry, unless the `hyper` option has been set to `false`. You can disable or enable links using:

```
\glsdisablehyper \glsenablehyper
```

and

```
\glsenablehyper \glsenablehyper
```

respectively. The effect can be localised by placing the commands within a group. Note that you should only use `\glsenablehyper` if the commands `\hyperlink` and `\hypertarget` have been defined (for example, by the `hyperref` package).

3.5 Adding an entry to the glossary without generating text

`\glsadd` It is possible to add a line in the glossary file without generating any text at that point in the document using:

```
\glsadd[<options>]{<label>}
```

This is similar to `\glslink`, only it doesn’t produce any text (so therefore, there is no `hyper` key available in `<options>` but all the other options that can be used with `\glslink` can be passed to `\glsadd`). For example, to add a page range to the glossary number list for the entry whose label is given by `set`:

```
\glsadd[format=()]{set}
Lots of text about sets spanning many pages.
\glsadd[format=()]{set}
```

`\glsaddall` To add all entries that have been defined, use:

```
\glsaddall[<options>]
```

The optional argument is the same as for `\glsadd`, except there is also a key `types` which can be used to specify which glossaries to use. This should be a comma separated list. For example, if you only want to add all the entries belonging to the list of acronyms (specified by the glossary type `\acronymtype`) and a list of notation (specified by the glossary type `notation`) then you can do:

```
\glsaddall[types={\acronymtype,notation}]
```

3.6 Displaying a glossary

`\printglossaries`

The command `\printglossaries` will display all the glossaries in the order in which they were defined. Note that no glossaries will appear until you have either used the Perl script `makerglossaries` or have directly used `makeindex` (as described in subsection 1.2). If the glossary still does not appear after you re-L^AT_EX your document, check the `makeindex` log files to see if there is a problem. Remember that you also need to use the command `\makerglossaries` in the preamble to enable the glossaries.

`\printglossary`

An individual glossary can be displayed using:

```
\printglossary[<options>]
```

where `<options>` is a `<key>=<value>` list of options. The following keys are available:

type The value of this key specifies which glossary to print. If omitted, the default glossary is assumed. For example, to print the list of acronyms:

```
\printglossary[type=\acronymtype]
```

title This is the glossary's title (overriding the title specified when the glossary was defined).

toctitle This is the title to use for the table of contents (if the `toc` package option has been used). If omitted, the glossary title is used.

style This specifies which glossary style to use for this glossary, overriding the effect of the `style` package option or `\glossarystyle`.

numberedsection This specifies whether to use a numbered section for this glossary, overriding the effect of the `numberedsection` package option. This key has the same syntax as the `numberedsection` package option, described in subsection 3.1.

nonumberlist Unlike the package option of the same name, this key is a boolean key. If true (`nonumberlist=true`) the numberlist is suppressed for this glossary. If false (`nonumberlist=false`) the numberlist is displayed for this glossary. If no value is supplied, true is assumed.

`\glossarypreamble`

Information can be added to the start of the glossary by redefining `\glossarypreamble`. For example:

```
\renewcommand{\glossarypreamble}{Numbers in italic indicate  
primary definitions.}
```

This needs to be done before the glossary is displayed using `\printglossaries` or `\printglossary`. Note that if you want a different preamble for each glossary, you will need to use a separate `\printglossary` for each glossary and change the definition of `\glossarypreamble` between each glossary. For example:

```
\renewcommand{\glossarypreamble}{Numbers in italic indicate  
primary definitions.}  
\printglossary  
\renewcommand{\glossarypreamble}{}  
\printglossary[type=acronym]
```

Alternatively, you can do something like:

```
\renewcommand{\glossarypreamble}{Numbers in italic indicate
primary definitions.\gdef\glossarypreamble{}}
\printglossaries
```

which will print the preamble text for the first glossary and change the preamble to do nothing for subsequent glossaries. (Note that `\gdef` is required as the glossary is placed within a group.)

There is an analogous command called `\glossarypostamble` which is placed at the end of each glossary.

3.6.1 Changing the way the entry name appears in the glossary

`\glsnamefont` Within each glossary, each entry name is formatted according to `\glsnamefont` which takes one argument: the entry name. This command is always used regardless of the glossary style. By default, `\glsnamefont` simply displays its argument in whatever the surrounding font happens to be. This means that in the list styles the name will appear in bold, since the name is placed in the optional argument of `\item`, whereas in the tabular styles the name will appear in the normal font.

For example, suppose you want all the entry names to appear in medium weight small caps, then you can do:

```
\renewcommand{\glsnamefont}[1]{\textsc{\mdseries #1}}
```

3.7 Defining New Glossaries

`\newglossary` A new glossary can be defined using:

```
\newglossary[<log-ext>]{<name>}{<in-ext>}{<out-ext>}{<title>}[<counter>]
```

where `<name>` is the label to assign to this glossary. The arguments `<in-ext>` and `<out-ext>` specify the extensions to give to the input and output files for that glossary, `<title>` is the default title for this new glossary and the final optional argument `<counter>` specifies which counter to use for the associated number lists (see also [subsection 3.3](#)). The first optional argument specifies the extension for the `makeindex` transcript file (this information is only used by `maketoc` which picks up the information from the auxiliary file).

Note that the main (default) glossary is automatically created as:

```
\newglossary{main}{gls}{glo}{\glossaryname}
```

so it can be identified by the label `main`. Using the `acronym` package option is equivalent to:

```
\newglossary[alg]{acronym}{acr}{acn}{\acronymname}
```

so it can be identified by the label `acronym`. If you are not sure whether the `acronym` option has been used, you can identify the list of acronyms by the command `\acronymtype` which is set to `acronym`, if the `acronym` option has been used, otherwise it is set to `main`.

3.8 Acronyms

`\newacronym` As you may have noticed in [subsection 3.2](#), when you specify a new entry, you can specify alternate text to use when the term is first used in the document. This provides a useful means to define acronyms. For convenience, the `glossaries` package defines the command:

```
\newacronym[⟨key-val list⟩]{⟨label⟩}{⟨abbrv⟩}{⟨long⟩}
```

By default, this is equivalent to:

```
\newglossaryentry{⟨label⟩}{type=\acronymtype,
  name={⟨abbrv⟩},
  description={⟨long⟩},
  text={⟨abbrv⟩},
  first={⟨long⟩ ⟨⟨abbrv⟩⟩},
  plural={⟨abbrv⟩\glspluralsuffix},
  firstplural={⟨long⟩\glspluralsuffix\space ⟨⟨abbrv⟩\glspluralsuffix⟩},
  ⟨key-val list⟩}
```

As mentioned in the previous section, the command `\acronymtype` is the name of the glossary in which the acronyms should appear. If the `acronym` package option has been used, this will be `acronym`, otherwise it will be `main`. The acronyms can then be used in exactly the same way as any other glossary entry.

Note: since `\newacronym` sets `type=\acronymtype`, if you want to load a file containing acronym definitions using `\loadglsentries[⟨type⟩]{⟨filename⟩}`, the optional argument `⟨type⟩` will not have an effect unless you explicitly set the type as `type=\glsdefaulttype`. See [subsubsection 3.2.2](#).

For example, the following defines the acronym IDN:

```
\newacronym{idn}{IDN}{identification number}
```

This is equivalent to:

```
\newglossaryentry{idn}{type=\acronymtype,
  name={IDN},
  description={identification number},
  text={IDN},
  first={identification number (IDN)},
  plural={IDNs},
  firstplural={identification numbers (IDNs)}}
```

so `\gls{idn}` will produce “identification number (IDN)” on first use and “IDN” on subsequent uses.

This section describes acronyms that have been defined using `\newacronym`. If you prefer to define all your acronyms using `\newglossaryentry` explicitly, then you should skip this section and ignore the package options: `smallcaps`, `smaller`, `description`, `dua`, `footnote` and `shortcuts`, as these options change the definition of `\newacronym` for common acronym formats as well as the way that the link text is displayed (see [subsubsection 3.4.1](#)). Likewise you should ignore the new commands described in this section, such as `\acrshort`, as they vary according to the definition of `\newacronym`.

\acronymfont

Table 2 lists the package options and how the \newglossaryentry keys are used to store $\langle long \rangle$ (the long form) and $\langle abbrv \rangle$ (the short form). Note that the `smallcaps` option redefines `\acronymfont` so that it sets its argument using `\textsc` (so you should use lower case characters in $\langle abbrv \rangle$) and the `smaller` option redefines `\acronymfont` to use `\smaller`,⁵ otherwise `\acronymfont` simply displays its argument in the surrounding font. Note also that if none of the package options `smallcaps`, `smaller`, `dua`, `description` or `footnote` are used, `\acronymfont` is not used, so changing the definition of `\acronymfont` will have no effect under such circumstances.

If you want to display the acronym in another font, for example, emphasized, then use the `smaller` package option and redefine `\acronymfont` to use the required font. For example:

```
\usepackage[smaller]{glossaries}
\renewcommand*\acronymfont[1]{\emph{#1}}
```

\firstacronymfont

Where `\acronymfont` is available, `\firstacronymfont` is also available. By default, this simply uses `\acronymfont`, but it can be redefined to change the way the acronym is displayed on first use.

Table 2: Package options governing `\newacronym` and how the information is stored in the keys for `\newglossaryentry`

Package Option	first key	text key	description key	symbol key
<code>description,footnote</code>	$\langle abbrv \rangle$	$\langle abbrv \rangle$	user supplied	$\langle long \rangle$
<code>description,dua</code>	$\langle long \rangle$	$\langle long \rangle$	user supplied	$\langle abbrv \rangle$
<code>description</code>	$\langle long \rangle$	$\langle abbrv \rangle$	user supplied	$\langle abbrv \rangle$
<code>footnote</code>	$\langle abbrv \rangle$	$\langle abbrv \rangle$	$\langle long \rangle$	
<code>smallcaps</code>	$\langle long \rangle$	$\langle abbrv \rangle$	$\langle long \rangle$	$\langle abbrv \rangle$
<code>smaller</code>	$\langle long \rangle$	$\langle abbrv \rangle$	$\langle long \rangle$	$\langle abbrv \rangle$
<code>dua</code>	$\langle long \rangle$	$\langle long \rangle$	$\langle long \rangle$	$\langle abbrv \rangle$
None of the above	$\langle long \rangle$ (($\langle abbrv \rangle$))	$\langle abbrv \rangle$	$\langle long \rangle$	

In case you can't remember which key stores the long or short forms (or their plurals) the `glossaries` package provides the commands:

\glsshortkey

- `\glsshortkey` The key used to store the short form.

\glsshortpluralkey

- `\glsshortpluralkey` The key used to store the plural version of the short form.

\glslongkey

- `\glslongkey` The key used to store the long form.

\glslongpluralkey

- `\glslongpluralkey` The key used to store the plural version of the long form.

These can be used in the optional argument of `\newacronym` to override the defaults. For example:

```
\newacronym[\glslongpluralkey={diagonal matrices}]{dm}{DM}{diagonal matrix}
```

⁵you will need to load a package, such as `relsize`, that defines `\smaller` if you use this option.

If the first use uses the plural form, `\glsp{dm}` will display: diagonal matrices (DMs).

Each of the package options `smallcaps`, `smaller`, `footnote`, `dua` and `description` use `\defglsdisplay` and `\defglsdisplayfirst` (described in [subsubsection 3.4.1](#)) to change the way the link text is displayed.

description,footnote

When these two package options are used together, the first use displays the entry as:

```
\firstacronymfont{\textit{abbrv}}\textit{insert}\footnote{\textit{long}}
```

while subsequent use displays the entry as:

```
\acronymfont{\textit{abbrv}}\textit{insert}
```

where `\textit{insert}` indicates the text supplied in the final optional argument to `\gls`, `\glsp` or their uppercase variants.

Note also that when these two package options are used (in the given order), the `glossaries` package additionally implements the `sanitize` option using `sanitize={description=false,symbol=false}`, so remember to protect fragile commands when defining acronyms.

dua

The `dua` package option always displays the expanded form and so may not be used with `footnote`, `smaller` or `smallcaps`. Both first use and subsequent use displays the entry in the form:

```
\textit{long}\textit{insert}
```

If the `description` package option is also used, the `name` key is set to the long form, otherwise the `name` key is set to the short form and the `description` key is set to the long form.

description

This package option displays the entry on first use as:

```
\textit{long}\textit{insert} (\firstacronymfont{\textit{abbrv}})
```

while subsequent use displays the entry as:

```
\acronymfont{\textit{abbrv}}\textit{insert}
```

Note also that if this package option is used, the `glossaries` package additionally implements the option `sanitize={symbol=false}`, so remember to protect fragile commands when defining acronyms.

footnote

This package option displays the entry on first use as:

```
\firstacronymfont{\textit{abbrv}}\textit{insert}\footnote{\textit{long}}
```

while subsequent use displays the entry as:

```
\acronymfont{(abbrv)}{insert}
```

Note also that if this package option is used, the `glossaries` package additionally implements the option `sanitize={description=false}`, so remember to protect fragile commands when defining acronyms.

smallcaps

If neither the `footnote` nor `description` options have been set, this option displays the entry on first use as:

```
{long}{insert} (\firstacronymfont{(abbrv)})
```

while subsequent use displays the entry as:

```
\acronymfont{(abbrv)}{insert}
```

where `\acronymfont` is set to `\textsc{#1}`, so `(abbrv)` should be specified in lower case.

Note also that if this package option is used, the `glossaries` package additionally implements the option `sanitize={symbol=false}`, so remember to protect fragile commands when defining acronyms.

smaller

If neither the `footnote` nor `description` options have been set, this option displays the entry on first use as:

```
{long}{insert} (\firstacronymfont{(abbrv)})
```

while subsequent use displays the entry as:

```
\acronymfont{(abbrv)}{insert}
```

where `\acronymfont` is set to `{\smaller #1}`.

Remember to load a package that defines `\smaller` (such as `relsize`) if you want to use this option.

Note also that if this package option is used, the `glossaries` package additionally implements the option `sanitize={symbol=false}`, so remember to protect fragile commands when defining acronyms.

None of the above

If none of the package options `smallcaps`, `smaller`, `footnote`, `dua` or `description` are used, then on first use the entry is displayed as:

```
{long} ({abbrv}){insert}
```

while subsequent use displays the entry as:

```
{abbrv}{insert}
```

Recall from [subsection 3.4](#) that you can access the values of individual keys using commands like `\gls{text}`, so it is possible to use these commands to print just the long form or just the abbreviation without affecting the flag that determines whether the entry has been used. However the keys that store the long and short form vary depending on the acronym style, so the `glossaries` package provides commands that are set according to the package options. These are as follows:

```
\acrshort  \acrshort[⟨options⟩]{⟨label⟩}{⟨insert⟩}
\Acrshort \ACRshort[⟨options⟩]{⟨label⟩}{⟨insert⟩}
\ACRshort \ACRshort[⟨options⟩]{⟨label⟩}{⟨insert⟩}
```

Print the abbreviated version with a hyperlink (if necessary) to the relevant entry in the glossary. This is usually equivalent to `\gls{text}` (or its uppercase variants) but may additionally put the link text within the argument to `\acronymfont`.

```
\acrlong  \acrlong[⟨options⟩]{⟨label⟩}{⟨insert⟩}
\Acrlong \ACRlong[⟨options⟩]{⟨label⟩}{⟨insert⟩}
\ACRlong \ACRlong[⟨options⟩]{⟨label⟩}{⟨insert⟩}
```

Print the long version with a hyperlink (if necessary) to the relevant entry in the glossary. This is may be equivalent to `\glsdesc`, `\glssymbol` or `\glsfirst` (or their uppercase variants), depending on package options.

```
\acrfull  \acrfull[⟨options⟩]{⟨label⟩}{⟨insert⟩}
\Acrfull \ACRfull[⟨options⟩]{⟨label⟩}{⟨insert⟩}
\ACRfull \ACRfull[⟨options⟩]{⟨label⟩}{⟨insert⟩}
```

Print the long version followed by the abbreviation in brackets with a hyperlink (if necessary) to the relevant entry in the glossary.

Note that if you change the definition of `\newacronym`, you may additionally need to change the above commands as well as the changing way the text is displayed using `\defglsdisplay` and `\defglsdisplayfirst`.

The package option `shortcuts` provides the synonyms listed in [table 3](#). If any of those commands generate an “undefined control sequence” error message, check that you have enabled the `shortcuts` package option. Note that there are no shortcuts for the commands that produce all upper case text.

3.9 Unsetting and resetting entry flags

When using `\gls`, `\glsp` and their uppercase variants it is possible that you may want to use the value given by the first key, even though you have already used the glossary entry. Conversely, you may want to use the value given by the `text` key, even though you haven’t used the glossary entry. The former can be achieved by one of the following commands:

```
\glsreset \glsreset{⟨label⟩}
\glslocalreset \glslocalreset{⟨label⟩}
```

while the latter can be achieved by one of the following commands:

```
\glsunset \glsunset{⟨label⟩}
```

Table 3: Synonyms provided by the package option `shortcuts`

Shortcut Command	Equivalent Command
<code>\acs</code>	<code>\acrshort</code>
<code>\Acs</code>	<code>\Acrshort</code>
<code>\acsp</code>	<code>\acrshortpl</code>
<code>\Acsp</code>	<code>\Acrshortpl</code>
<code>\acl</code>	<code>\acrlong</code>
<code>\Acl</code>	<code>\Acrlong</code>
<code>\aclp</code>	<code>\acrlongpl</code>
<code>\Aclp</code>	<code>\Acrlongpl</code>
<code>\acf</code>	<code>\acrfull</code>
<code>\Acf</code>	<code>\Acrfull</code>
<code>\acfp</code>	<code>\acrfullpl</code>
<code>\Acfp</code>	<code>\Acrfullpl</code>
<code>\ac</code>	<code>\gls</code>
<code>\Ac</code>	<code>\Gls</code>
<code>\acp</code>	<code>\glsp</code>
<code>\Acp</code>	<code>\Glspl</code>

```
\glslocalunset \glslocalunset{\label}
```

You can determine whether an entry has been used using:

```
\ifglsused \ifglsused{\label}{\truepart}{\falsepart}
```

where `\label` is the label of the required entry. If the entry has been used, `\truepart` will be done, otherwise `\falsepart` will be done.

3.10 Glossary Styles

The `glossaries` package comes with some pre-defined glossary styles. These are as follows:

list The `list` style uses the `description` environment. The entry name is placed in the optional argument of the `\item` command (so it will appear in bold by default). The description follows, and then the associated number list for that entry. Sub groups are separated using `\indexspace`.

listgroup The `listgroup` style is like `list` but the glossary groups have headings.

listhypergroup The `listhypergroup` style is like `listgroup` but has a set of links to the glossary groups. The start of the glossary has a navigation panel to each group that is present in the glossary. This requires an additional run through L^AT_EX to ensure the group information is up-to-date. In the navigation panel, each group is separated by `\glshypernavsep` which defaults to a vertical bar with a space on either side. For example, to simply have a space separating each group, do:

```
\renewcommand*\glshypernavsep{\space}
```

Note that the hyper-navigation panel is now (as from version 1.14) set inside the optional argument to `\item` instead of after it to prevent a spurious space at the start. This can be changed by redefining `\glossaryheader`, but note that this needs to be done *after* the glossary style has been set.

altlist The `altlist` style is like `list` but the description is placed on the following line.

altlistgroup The `altlistgroup` style is like `altlist` but the glossary groups have headings.

altlisthypergroup The `altlisthypergroup` style is like `altlistgroup` but has a set of links to the glossary groups. The navigation panel is the same as that for `listhypergroup`, described above.

listdotted This style uses the `description` environment. Each entry starts with `\item[]`, followed by the name followed by a dotted line, followed by the description. Note that this style ignores both the number list and the symbol. The length `\glslistdottedwidth` governs where the description should start.⁶

long The `long` style uses the `longtable` environment (defined by the `longtable` package). It has two columns: the first column contains the entry's name and the second column contains the description followed by the number list. Sub groups are separated with a blank row.

longborder The `longborder` style is like `long` but has horizontal and vertical lines around it.

longheader The `longheader` style is like `long` but has a header row.

longheaderborder The `longheaderborder` style is like `longheader` but has horizontal and vertical lines around it.

long3col The `long3col` style is like `long` but has three columns. The first column contains the entry's name, the second column contains the description and the third column contains the number list.

long3colborder The `long3colborder` style is like the `long3col` style but has horizontal and vertical lines around it.

long3colheader The `long3colheader` style is like `long3col` but has a header row.

long3colheaderborder The `long3colheaderborder` style is like `long3colheader` but has horizontal and vertical lines around it.

long4col The `long4col` style is like `long3col` but has an additional column in which the entry's associated symbol appears.

long4colborder The `long4colborder` style is like the `long4col` style but has horizontal and vertical lines around it.

long4colheader The `long4colheader` style is like `long4col` but has a header row.

⁶This style was supplied by Axel Menzel.

long4colheaderborder The `long4colheaderborder` style is like `long4colheader` but has horizontal and vertical lines around it.

super The `super` style uses the `supertabular` environment (defined by the `supertabular` package). It has two columns: the first column contains the entry's name and the second column contains the description followed by the number list. Sub groups are separated with a blank row.

superborder The `superborder` style is like `super` but has horizontal and vertical lines around it.

superheader The `superheader` style is like `super` but has a header row.

superheaderborder The `superheaderborder` style is like `superheader` but has horizontal and vertical lines around it.

super3col The `super3col` style is like `super` but has three columns. The first column contains the entry's name, the second column contains the description and the third column contains the .

super3colborder The `super3colborder` style is like the `super3col` style but has horizontal and vertical lines around it.

super3colheader The `super3colheader` style is like `super3col` but has a header row.

super3colheaderborder The `super3colheaderborder` style is like `super3colheader` but has horizontal and vertical lines around it.

super4col The `super4col` style is like `super3col` but has an additional column in which the entry's associated symbol appears.

super4colborder The `super4colborder` style is like the `super4col` style but has horizontal and vertical lines around it.

super4colheader The `super4colheader` style is like `super4col` but has a header row.

super4colheaderborder The `super4colheaderborder` style is like `super4colheader` but has horizontal and vertical lines around it.

The glossary style can be set using the `style` package option or using the `style` key in the optional argument to `\printglossary` or using the command:

```
\glossarystyle \glossarystyle{\langle style-name\rangle}
```

Note that if you use the `style` key in the optional argument to `\printglossary`, it will override any previous style settings for the given glossary, so if, for example, you do:

```
\renewcommand*\glsgroupskip{}  
\printglossary[style=long]
```

The new definition of `\glsgroupskip` will not have an affect for this glossary, as `\glsgroupskip` is redefined by `style=long`. Likewise, `\glossarystyle` will also override any previous style definitions, so, again:

```
\renewcommand*{\glsgroupskip}{}  
\glossarystyle{long}
```

will reset `\glsgroupskip` back to its default definition for the named glossary style (“long” in this case). If you want to modify the styles, either use `\newglossarystyle` (described in the next section) or make the modifications after `\glossarystyle`.

`\glspostdescription` All the styles except for the three- and four-column styles and the `listdotted` style use the command `\glspostdescription` after the description. This simply displays a full stop by default. To eliminate this full stop (or replace it with something else, say a comma) you will need to redefine `\glspostdescription` before the glossary is displayed.

3.11 Defining your own glossary style

If the predefined styles don’t fit your requirements, you can define your own style using:

```
\newglossarystyle{\langle name\rangle}{\langle definitions\rangle}
```

where `\langle name\rangle` is the name of the new glossary style (to be used in `\glossarystyle`). The second argument `\langle definitions\rangle`, needs to redefine all of the following:

`theGLOSSARY` `theGLOSSARY`

This environment defines how the main body of the glossary should be typeset. Note that this does not include the section heading, the glossary preamble (defined by `\glossarypreamble`) or the glossary postamble (defined by `\glossarypostamble`.) For example, the `list` style uses the `description` environment, so the `theGLOSSARY` environment is simply redefined to begin and end the `description` environment.

`\GLOSSARYHEADER` `\GLOSSARYHEADER`

This macro indicates what to do at the start of the main body of the glossary. Note that this is not the same as `\glossarypreamble`, which should not be affected by changes in the glossary style. The `list` glossary style redefines `\GLOSSARYHEADER` to do nothing, whereas the `longheader` glossary style redefines `\GLOSSARYHEADER` to do a header row.

`\glsgroupheading` `\glsgroupheading{\langle label\rangle}`

This macro indicates what to do at the start of each logical block within the main body of the glossary. The glossary is sub-divided into twenty-eight logical blocks that are determined by the first character of the `sort` key (or `name` key if the `sort` key is omitted). The sub-divisions are in the following order: symbols, numbers, A, ..., Z. Note that the argument to `\glsgroupheading` is a label *not* the group title. The group title can be obtained via `\glsgetgroupTitle{\langle label\rangle}`, and a navigation hypertarget can

be created using `\glsnavhypertarget{\label}`. Most of the predefined glossary styles redefine `\glsgroupheading` to simply ignore its argument. The `listhypergroup` style redefines `\glsgroupheading` as follows:

```
\renewcommand*{\glsgroupheading}[1]{%
\item[\glsnavhypertarget{\##1}{\glsgetgrouptitle{\##1}}]}
```

See also `\glsgroupskip` below. (Note that command definitions within `\newglossarystyle` must use `##1` etc instead of `#1` etc.)

`\glsgroupskip` `\glsgroupskip`

This macro determines what to do after one logical group but before the header for the next logical group. The `list` glossary style simply redefines `\glsgroupskip` to be `\indexspace`.

`\glossaryentryfield` `\glossaryentryfield{\label}{\formattedname}{\description}{\symbol}{\numberlist}`

This macro indicates what to do for a given glossary entry. Note that `\formattedname` will always be in the form `\glsnamefont{\name}`. This allows the user to set a given font for the entry name, regardless of the glossary style used. Note that `\label` is the label used when the glossary entry was defined via either `\newglossaryentry` or `\newacronym`. Each time you use a glossary entry it creates a link⁷ using `\@glslink{\label}{\text}` with the label `\glo:\label`. Your new glossary style must therefore redefine `\glossaryentryfield` so that it uses `\@glstarget{\glo:\label}{\text}` to ensure the hyperlinks function correctly.⁸ For example, the `list` style defines `\glossaryentryfield` as follows:

```
\renewcommand*{\glossaryentryfield}[5]{%
\item[\@glstarget{\glo:\##1}{\##2}] ##3\glspostdescription\space ##5}
```

Note also that `\numberlist` will always be of the form

```
\glossaryentrynumbers{\relax
\setentrycounter{\countername}\glsnumberformat{\number(s)}}
```

where `\number(s)` may contain `\delimN` (to delimit individual numbers) and/or `\delimR` (to indicate a range of numbers). There may be multiple occurrences of `\setentrycounter{\countername}\glsnumberformat{\number(s)}`, but note that the entire number list is enclosed within the argument to `\glossaryentrynumbers`. The user can redefine this to change the way the entire number list is formatted, regardless of the glossary style. However the most common use of `\glossaryentrynumbers` is to provide a means of suppressing the number list altogether. (In fact, the `nonumberlist` option redefines `\glossaryentrynumbers` to ignore its argument.) Therefore, when you define a new glossary style, you don't need to worry about whether the user has specified the `nonumberlist` package option.

⁷if the document doesn't have hyperlinks enabled `\@glslink` ignores the label and simply typesets the text.

⁸again, if the document doesn't support hyperlinks, `\@glstarget` will ignore the label, and just typeset the text.

3.11.1 Example: creating a completely new style

If you want a completely new style, you will need to redefine all of the commands and environment listed above. You also need to take care when using internal commands (commands whose name contain the @ symbol). These should either be used in a `.sty` file or must be placed within `\makeatletter` and `\makeatother`.

For example, suppose you want each entry to start with a bullet point. This means that the glossary should be placed in the `itemize` environment, so `theglossary` should start and end that environment. Let's also suppose that you don't want anything between the glossary groups (so `\glsgroupheading` and `\glsgroupskip` should do nothing) and suppose you don't want anything to appear immediately after `\begin{theglossary}` (so `\glossaryheader` should do nothing). In addition, let's suppose the symbol should appear in brackets after the name, followed by the description and last of all the number list should appear within square brackets at the end. Then you can create this new glossary style, called, say, `mylist`, as follows:

```
\newglossarystyle{mylist}{%
% put the glossary in the itemize environment:
\renewenvironment{theglossary}{\begin{itemize}}{\end{itemize}}%
% have nothing after \begin{theglossary}:
\renewcommand*\glossaryheader{}%
% have nothing between glossary groups:
\renewcommand*\glsgroupheading[1]{}%
\renewcommand*\glsgroupskip{}%
% set how each entry should appear:
\renewcommand*\glossaryentryfield[5]{%
\item % bullet point
\@glstarget{glo:##1}{##2}% the entry name
\space (##4)% the symbol in brackets
\space ##3% the description
\space [##5]% the number list in square brackets
}%
}
```

3.11.2 Example: creating a new glossary style based on an existing style

If you want to define a new style that is a slightly modified version of an existing style, you can use `\glossarystyle` within the second argument of `\newglossarystyle` followed by whatever alterations you require. For example, suppose you want a style like the `list` style but you don't want the extra vertical space created by `\indexspace` between groups, then you can create a new glossary style called, say, `mylist` as follows:

```
\newglossarystyle{mylist}{%
\glossarystyle{list}% base this style on the list style
\renewcommand*\glsgroupskip{}% make nothing happen between groups
}
```

4 Mfirstuc Package

The glossaries package is supplied with the package `mfirstuc` which provides the command:

```
\makefirstuc \makefirstuc{\langle stuff\rangle}
```

which makes the first object of `\langle stuff\rangle` uppercase unless `\langle stuff\rangle` starts with a control sequence followed by a non-empty group, in which case the first object in the group is converted to uppercase. Examples:

- `\makefirstuc{abc}` produces `Abc`
- `\makefirstuc{\emph{abc}}` produces `Abc` (`\MakeUppercase` has been applied to the letter “a” rather than `\emph`.)
- `\makefirstuc{\{'a}bc}` produces `Ábc`
- `\makefirstuc{\ae bc}` produces `Æbc`
- `\makefirstuc{\{æ}bc}` produces `Æbc`

In version 1.02 of `mfirstuc`, a bug fix resulted in a change in output if the first object is a control sequence followed by an empty group. Prior to version 1.02, `\makefirstuc{\æ{}bc}` produced `æBc`. However as from version 1.02, it now produces `Æbc`.

Note also that

```
\newcommand{\abc}{abc}
\makefirstuc{\abc}
```

produces: `ABC`. This is because the first object in the argument of `\makefirstuc` is `\abc`, so it does `\MakeUppercase{\abc}`. Whereas:

```
\newcommand{\abc}{abc}
\expandafter\makefirstuc\expandafter{\abc}
```

produces: `Abc`. There is a short cut command which will do this:

```
\xmakefirstuc \xmakefirstuc{\langle stuff\rangle}
```

This is equivalent to `\expandafter\makefirstuc\expandafter{\langle stuff\rangle}`. So

```
\newcommand{\abc}{abc}
\xmakefirstuc{\abc}
```

produces: `Abc`.

If you want to use an alternative command to convert to uppercase, for example `\MakeTextUppercase`⁹, you can redefine the internal command `\@gls@makefirstuc`. For example:

```
\renewcommand{\@gls@makefirstuc}[1]{\MakeTextUppercase #1}
```

(Remember that command names that contain the @ character must either be placed in packages or be placed between `\makeatletter` `\makeatother`.)

⁹defined in the `textcase` package

5 Documented Code

5.1 Package Definition

This package requires L^AT_EX 2_E.

```
1 \NeedsTeXFormat{LaTeX2e}
2 \ProvidesPackage{glossaries}[2008/06/17 v1.14 (NLCT)]
```

Required packages:

```
3 \RequirePackage{ifthen}
4 \RequirePackage{xkeyval}[2006/11/18]
5 \RequirePackage{mfirstuc}
```

If `babel` package is loaded, check to see if `translator` is installed.

```
6 \@ifpackageloaded{babel}{\IfFileExists{translator.sty}{%
7   \RequirePackage{translator}}{}}
```

Need to use `\new@ifnextchar` instead of `\@ifnextchar` in commands that have a final optional argument (such as `\gls`) so require `amsgen`. Thanks to Morten Høgholm for suggesting this. (This has replaced using the `xspace` package.)

```
8 \RequirePackage{amsgen}
```

5.2 Package Options

The `toc` package option will add the glossaries to the table of contents. This is a boolean key, if the value is omitted it is taken to be true.

```
9 \define@boolkey{glossaries.sty}[gls]{toc}[true]{}
```

The `numberline` package option adds `\numberline` to `\addcontentsline`. Note that this option only has an effect if used in with `toc=true`.

```
10 \define@boolkey{glossaries.sty}[gls]{numberline}[true]{}
```

The sectional unit used to start the glossary is stored in `\@@glossarysec`. If chapters are defined, this is initialised to `chapter`, otherwise it is initialised to `section`.

```
\@@glossarysec
11 \@ifundefined{chapter}{\newcommand*\{\@@glossarysec\}{section}}{%
12 \newcommand*\{\@@glossarysec\}{chapter}}
```

The `section` key can be used to set the sectional unit. If no unit is specified, use `section` as the default. The starred form of the named sectional unit will be used. If you want some other way to start the glossary section (e.g. a numbered section) you will have to redefine `\glossarysection`.

```
13 \define@choicekey{glossaries.sty}{section}{part,chapter,section,%
14 subsection,subsubsection,paragraph,subparagraph}{section}{%
15 \renewcommand*\{\@@glossarysec\}{#1}}
```

Determine whether or not to use numbered sections.

```
\@@glossarysecstar
16 \newcommand*\{\@@glossarysecstar\}{*}
```

```
\@@glossaryseclabel
17 \newcommand*\{\@@glossaryseclabel\}{}
```

```

\glsautoprefix Prefix to add before label if automatically generated:
18 \newcommand*{\glsautoprefix}{}%
19 \define@choicekey{glossaries.sty}{numberedsection}[\val\nr]{%
20 false,nolabel,autolabel}[nolabel]{%
21 \ifcase\nr\relax
22 \renewcommand*{\@glossarysecstar}{*}%
23 \renewcommand*{\@glossaryseclabel}{ }%
24 \or
25 \renewcommand*{\@glossarysecstar}{ }%
26 \renewcommand*{\@glossaryseclabel}{ }%
27 \or
28 \renewcommand*{\@glossarysecstar}{ }%
29 \renewcommand*{\@glossaryseclabel}{\label{\glsautoprefix@\glo@type}}%
30 \fi}

```

The default glossary style is stored in `\@glossary@default@style`. This is initialised to `list`. (The `list` style is defined in the accompanying `glossary-list` package described in [subsection 5.16](#).)

```

\@glossary@default@style
31 \newcommand*{\@glossary@default@style}{list}

```

The default glossary style can be changed using the `style` package option. The value can be the name of any defined glossary style. The glossary style is set at the beginning of the document, so you can still use the `style` key to set a style that is defined in another package. This package comes with some predefined styles that are defined in [subsection 5.16](#).

```

32 \define@key{glossaries.sty}{style}{%
33 \renewcommand*{\@glossary@default@style}{#1}}

```

Each entry within a given glossary will have an associated number list. By default, this refers to the page numbers on which that entry has been used, but it can also refer to any counter used in the document (such as the section or equation counters). The default number list format displays the number list “as is”:

```

\glossaryentrynumbers
34 \newcommand*{\glossaryentrynumbers}[1]{#1}

```

Note that the entire number list for a given entry will be passed to `\glossaryentrynumbers` so any font changes will also be applied to the delimiters. The `nonumberlist` package option suppresses the number lists (this simply redefines `\glossaryentrynumbers` to ignores its argument.)

```

35 \DeclareOptionX{nonumberlist}{%
36 \renewcommand*{\glossaryentrynumbers}[1]{}}

```

Keep track of the default glossary. This is initialised to the main glossary, but can be changed if for some reason you want to make a secondary glossary the main glossary. This affects any commands that can optionally take a glossary name as an argument (or as the value of the `type` key in a key-value list.) This was mainly done so that `\loadglsentries` can temporarily change `\glsdefaulttype` while it loads a file containing new glossary entries (see [subsection 5.8](#)).

```

\glsdefaulttype
37 \newcommand{\glsdefaulttype}{main}

```

Keep track of which glossary the acronyms are in. This is initialised to `\glsdefaulttype`, but is changed by the `acronym` package option.

```
\acronymtype
38 \newcommand{\acronymtype}{\glsdefaulttype}
```

The `acronym` option sets an associated conditional which is used in [subsection 5.14](#) to determine whether or not to define a separate glossary for acronyms.

```
39 \define@boolkey{glossaries.sty}[gls]{acronym}[true]{}
```

The default counter associated with the numbers in the glossary is stored in `\glscounter`. This is initialised to the page counter. This is used as the default counter when a new glossary is defined, unless a different counter is specified in the optional argument to `\newglossary` (see [subsection 5.5](#)).

```
\glscounter
40 \newcommand{\glscounter}{page}
```

The `counter` option changes the default counter. (This just redefines `\glscounter`.)

```
41 \define@key{glossaries.sty}{counter}{%
42 \renewcommand*{\glscounter}{#1}}
```

The glossary keys whose values are written to another file (i.e. `sort`, `name`, `description` and `symbol`) need to be sanitized, otherwise fragile commands would not be able to be used in `\newglossaryentry`. However, strange results will occur if you then use those fields in the document. As these fields are not normally used in the document, but are by default only used in the glossary, the default is to sanitize them. If however you want to use these values in the document (either by redefining commands like `\glsdisplay` or by using commands like `\glsentrydesc`) you will have to switch off the sanitization using the `sanitize` package option, but you will then have to use `\protect` to protect fragile commands when defining new glossary entries. The `sanitize` option takes a key-value list as its value, which can be used to switch individual values on and off. For example:

```
\usepackage[sanitize={description,name,symbol=false}]{glossaries}
```

will switch off the sanitization for the `symbol` key, but switch it on for the `description` and `name` keys. This would mean that you can use fragile commands in the `description` and `name` when defining a new glossary entry, but not for the `symbol`.

The default values are defined as:

```
\@gls@sanitizedesc
43 \newcommand*{\@gls@sanitizedesc}{\@onellevel@sanitize\@glo@desc}
```

```
\@gls@sanitizename
44 \newcommand*{\@gls@sanitizename}{\@onellevel@sanitize\@glo@name}
```

```
\@gls@sanitizesymbol
45 \newcommand*{\@gls@sanitizesymbol}{\@onellevel@sanitize\@glo@symbol}
```

(There is no equivalent for the `sort` key, since that is only provided for the benefit of `makeindex`, and so will always be sanitized.)

Before defining the `sanitize` package option, The key-value list for the `sanitize` value needs to be defined. These are all boolean keys. If they are not given a value, assume `true`.

Firstly the `description`. If set, it will redefine `\@gls@sanitizedesc` to use `\@onelevel@sanitize`, otherwise `\@gls@sanitizedesc` will do nothing.

```
46 \define@boolkey[gls]{sanitize}{description}[true]{%
47 \ifgls@sanitize@description
48   \renewcommand*{\@gls@sanitizedesc}{\@onelevel@sanitize\@glo@desc}%
49 \else
50   \renewcommand*{\@gls@sanitizedesc}{}%
51 \fi
52 }
```

Similarly for the `name` key:

```
53 \define@boolkey[gls]{sanitize}{name}[true]{%
54 \ifgls@sanitize@name
55   \renewcommand*{\@gls@sanitizename}{\@onelevel@sanitize\@glo@name}%
56 \else
57   \renewcommand*{\@gls@sanitizename}{}%
58 \fi}
```

and for the `symbol` key:

```
59 \define@boolkey[gls]{sanitize}{symbol}[true]{%
60 \ifgls@sanitize@symbol
61   \renewcommand*{\@gls@sanitizesymbol}{%
62 \@onelevel@sanitize\@glo@symbol}%
63 \else
64   \renewcommand*{\@gls@sanitizesymbol}{}%
65 \fi}
```

Now define the `sanitize` option. It can either take a key-val list as its value, or it can take the keyword `none`, which is equivalent to `description=false`, `symbol=false`, `name=false`:

```
66 \define@key{glossaries.sty}{sanitize}[description=true,symbol=true,
67 name=true]{%
68 \ifthenelse{\equal{#1}{none}}{%
69 \renewcommand*{\@gls@sanitizedesc}{}%
70 \renewcommand*{\@gls@sanitizename}{}%
71 \renewcommand*{\@gls@sanitizesymbol}{}%
72 }{\setkeys[gls]{sanitize}{#1}}%
73 }
```

Define `translate` option. If false don't set up multi-lingual support.

```
74 \define@boolkey{glossaries.sty}[gls]{translate}[true]{}
```

Set the default value:

```
75 \glstranslatefalse
76 \@ifpackage{translator}{\glstranslatetrue}{%
77 \ifpackage{babel}{\glstranslatetrue}{}}
```

Set the long form of the acronym in footnote on first use.

```
78 \define@boolkey{glossaries.sty}[glsacr]{footnote}[true]{%
79 \ifthenelse{\boolean{glsacrdescription}}{%
80 \renewcommand*{\@gls@sanitizedesc}{}{}}%
81 }
```

Allow acronyms to have a description (needs to be set using the `description` key in the optional argument of `\newacronym`).

```
82 \define@boolkey{glossaries.sty}[glsacr]{description}[true]{%
```

```

83 \renewcommand*{\@gls@sanitizesymbol}{}
84 }

Define \newacronym to set the short form in small capitals.
85 \define@boolkey{glossaries.sty}[glsacr]{smallcaps}[true]{%
86 \renewcommand*{\@gls@sanitizesymbol}{}
87 }

Define \newacronym to set the short form using \smaller which obviously needs
to be defined by loading the appropriate package.
88 \define@boolkey{glossaries.sty}[glsacr]{smaller}[true]{%
89 \renewcommand*{\@gls@sanitizesymbol}{}
90 }

Define \newacronym to always use the long forms (i.e. don't use acronyms)
91 \define@boolkey{glossaries.sty}[glsacr]{dua}[true]{%
92 \renewcommand*{\@gls@sanitizesymbol}{}
93 }

Define acronym shortcuts.
94 \define@boolkey{glossaries.sty}[glsacr]{shortcuts}[true]{}

    Process package options:
95 \ProcessOptionsX

    If chapters are defined and the user has requested the section counter as a
    package option, \chapter will be modified so that it adds a section.<n>.0
    target, otherwise entries placed before the first section of a chapter will have
    undefined links.

    The same problem will also occur if a lower sectional unit is used, but
    this is less likely to happen. If it does, or if you change \glscounter
    to section later, you will have to specify a different counter for the
    entries that give rise to a name{<section-level>.<n>.0} non-existent warning (e.g.
    \gls[counter=chapter]{label}).

96 \ifthenelse{\equal{\glscounter}{section}}{%
97 \@ifundefined{chapter}{}{%
98 \let\gls@old@chapter\chapter
99 \def\chapter[#1]#2{\gls@old@chapter[#1]{#2}}%
100 \ifundefined{hyperdef}{}{\hyperdef{section}{\thesection}}}}{}}
```

5.3 Default values

This section sets up default values that are used by this package. Some of the names may already be defined (e.g. by `babel`) so `\providecommand` is used.

Main glossary title:

```
\glossaryname
101 \providecommand*{\glossaryname}{Glossary}
```

The title for the `acronym` glossary type (which is defined if `acronym` package option is used) is given by `\acronymname`. If the `acronym` package option is not used, `\acronymname` won't be used.

```
\acronymname
102 \providecommand*{\acronymname}{Acronyms}
```

The following commands provide text for the headers used by some of the tabular-like glossary styles. Whether or not they get used in the glossary depends on the glossary style.

```
\entryname
103 \providecommand*\{\entryname\}{Notation}

\descriptionname
104 \providecommand*\{\descriptionname\}{Description}

\symbolname
105 \providecommand*\{\symbolname\}{Symbol}

\pagelistname
106 \providecommand*\{\pagelistname\}{Page List}

Labels for makeindex's symbol and number groups:

\glssymbolsgroupname
107 \providecommand*\{\glssymbolsgroupname\}{Symbols}

\glsnumbersgroupname
108 \providecommand*\{\glsnumbersgroupname\}{Numbers}

\glspluralsuffix The default plural is formed by appending \glspluralsuffix to the singular form.
109 \newcommand*\{\glspluralsuffix\}{s}

Add multi-lingual support. Thanks to everyone who contributed to the translations from both comp.text.tex and via email.
110 \ifglstranslate

If translator is not installed, used standard babel captions, otherwise load translator dictionary.
111   \@ifpackageloaded{translator}{\usedictionary{glossaries-dictionary}}%
112     \renewcommand*\{\glossaryname\}{\translate{Glossary}}%
113     \renewcommand*\{\acronymname\}{\translate{Acronyms}}%
114     \renewcommand*\{\entryname\}{\translate{Notation (glossaries)}}%
115     \renewcommand*\{\descriptionname\}{%
116       \translate{Description (glossaries)}}%
117     \renewcommand*\{\symbolname\}{\translate{Symbol (glossaries)}}%
118     \renewcommand*\{\pagelistname\}{%
119       \translate{Page List (glossaries)}}%
120     \renewcommand*\{\glssymbolsgroupname\}{%
121       \translate{Symbols (glossaries)}}%
122     \renewcommand*\{\glsnumbersgroupname\}{%
123       \translate{Numbers (glossaries)}}%
124   }%
125   \@ifpackageloaded{babel}{\RequirePackage{glossaries-babel}}{}}
126 \fi
```

The description terminator is given by `\glspostdescription` (except for the 3 and 4 column styles). This is a full stop by default:

```

\glspostdescription
127 \newcommand*{\glspostdescription}{.}

The name of the makeindex style file is given by \listfilename. This file
is created by \writeist (which is used by \makeglossaries) so redefining this
command will only have an effect if it is done before the .ist file is created.

\listfilename
128 \providecommand*{\listfilename}{\jobname.ist}

The makeglossaries Perl script picks up this name from the auxiliary file and
passes it to makeindex using the -s option. Since its not required by LATEX,
\@listfilename ignores its argument.

\@listfilename
129 \newcommand*{\@listfilename}[1]{}

This command is the value of the page_compositor makeindex key. Again,
any redefinition of this command must take place before \writeist otherwise it
will have no effect.

\glscompositor
130 \newcommand{\glscompositor}{.}

(The page compositor is usually defined as a dash when using makeindex, but
most of the standard counters used by LATEX use a full stop as the compositor,
which is why I have used it as the default.)

The command \glsnumberformat indicates the default format for the page
numbers in the glossary. (Note that this is not the same as \glossaryentrynumbers,
but applies to individual numbers or groups of numbers within an entry's associated
number list.) If hyperlinks are defined, it will use \glshypernumber, otherwise
it will simply display its argument “as is”.

\glsnumberformat
131 \@ifundefined{hyperlink}{%
132 \newcommand*{\glsnumberformat}[1]{#1}}{%
133 \newcommand*{\glsnumberformat}[1]{\glshypernumber{#1}}}

Individual numbers in an entry's associated number list are delimited using
\delimN (which corresponds to the delim_n makeindex keyword.) The default
value is a comma followed by a space.

\delimN
134 \newcommand{\delimN}{, }

A range of numbers within an entry's associated number list is delimited using
\delimR (which corresponds to the delim_r makeindex keyword.) The default is
an en-dash.

\delimR
135 \newcommand{\delimR}{--}

```

The glossary preamble is given by `\glossarypreamble`. This will appear after the glossary sectioning command, and before the `theglossary` environment. It is designed to allow the user to add information pertaining to the glossary (e.g. “page numbers in italic indicate the primary definition”) therefore `\glossarypreamble` shouldn’t be affected by the glossary style. (So if you define your own glossary style, don’t have it change `\glossarypreamble`.) The preamble is empty by default. If you have multiple glossaries, and you want a different preamble for each glossary, you will need to use `\printglossary` for each glossary type, instead of `\printglossaries`, and redefine `\glossarypreamble` before each `\printglossary`.

```
\glossarypreamble
136 \newcommand*{\glossarypreamble}{}%
```

The glossary postamble is given by `\glossarypostamble`. This is provided to allow the user to add something after the end of the `theglossary` environment (again, this shouldn’t be affected by the glossary style.) It is, of course, possible to simply add the text after `\printglossary`, but if you only want the postamble to appear after the first glossary, but not after subsequent glossaries, you can do something like:

```
\renewcommand{\glossarypostamble}{For a complete list of terms
see \cite{blah}\gdef\glossarypreamble{}}
```

```
\glossarypostamble
137 \newcommand*{\glossarypostamble}{}%
```

The sectioning command that starts a glossary is given by `\glossarysection`. (This does not form part of the glossary style, and so should not be changed by a glossary style.) If `\phantomsection` is defined, it uses `\p@glossarysection`, otherwise it uses `\@glossarysection`.

```
\glossarysection
138 \newcommand*{\glossarysection}[2][\@gls@title]{%
139 \def\@gls@title{\#2}%
140 \@ifundefined{phantomsection}{%
141 \@glossarysection{\#1}{\#2}}{\@p@glossarysection{\#1}{\#2}}%
142 \mkboth{\glossarytoctitle}{\glossarytoctitle}%
143 }
```

The required sectional unit is given by `\@glossarysec` which was defined by the `section` package option. The starred form of the command is chosen. If you don’t want any sectional command, you will need to redefine `\glossarysection`. The sectional unit can be changed, if different sectional units are required.

```
\setglossarysection
144 \newcommand*{\setglossarysection}[1]{%
145 \setkeys{glossaries.sty}{section=#1}}
```

The command `\@glossarysection` indicates how to start the glossary section if `\phantomsection` is not defined.

```

\@glossarysection
146 \newcommand*{\@glossarysection}[2]{%
147 \ifx\@glossarysecstar\empty
148   \csname\@glossarysec\endcsname{#2}%
149 \else
150   \csname\@glossarysec\endcsname*{#2}%
151   \gls@toc{#1}{\@glossarysec}%
152 \fi
153 \@@glossaryseclabel}

```

As `\@glossarysection`, but put in `\phantomsection`, and swap where `\gls@toc` goes. If using chapters do a `\clearpage`. This ensures that the hyper link from the table of contents leads to the line above the heading, rather than the line below it.

```

\@p@glossarysection
154 \newcommand*{\@p@glossarysection}[2]{%
155 \gls@docclearpage
156 \phantomsection
157 \ifx\@glossarysecstar\empty
158   \csname\@glossarysec\endcsname{#2}%
159 \else
160   \gls@toc{#1}{\@glossarysec}%
161   \csname\@glossarysec\endcsname*{#2}%
162 \fi
163 \@@glossaryseclabel}

```

The `\gls@docclearpage` command is used to issue a `\clearpage` (or `\cleardoublepage`) depending on whether the glossary sectional unit is a chapter. If the sectional unit is something else, do nothing.

```

\gls@docclearpage
164 \newcommand{\gls@docclearpage}{%
165 \ifthenelse{\equal{\@glossarysec}{chapter}}{%
166 \gls@undefined{cleardoublepage}{\clearpage}{\cleardoublepage}}{}%
167 }

```

The glossary is added to the table of contents if `glstoc` flag set. If it is set, `\gls@toc` will add a line to the `.toc` file, otherwise it will do nothing. (The first argument to `\gls@toc` is the title for the table of contents, the second argument is the sectioning type.)

```

\@gls@toc
168 \newcommand*{\@gls@toc}[2]{%
169 \ifglstoc
170   \ifglsnumberline
171     \addcontentsline{toc}{#2}{\numberline{}#1}%
172   \else
173     \addcontentsline{toc}{#2}{#1}%
174   \fi
175 \fi}

```

5.4 Loops and conditionals

To iterate through all glossaries (or comma-separated list of glossary names given in optional argument) use:

```
\forallglossaries[⟨glossary list⟩]{⟨cmd⟩}{⟨code⟩}
```

where ⟨cmd⟩ is a control sequence which will be set to the name of the glossary in the current iteration.

```
\forallglossaries  
176 \newcommand*{\forallglossaries}[3][\@glo@types]{%  
177 \for#2:=#1\do{\ifthenelse{\equal{#2}{}{}}{#3}}}
```

To iterate through all entries in a given glossary use:

```
\forglsentries[⟨type⟩]{⟨cmd⟩}{⟨code⟩}
```

where ⟨type⟩ is the glossary label and ⟨cmd⟩ is a control sequence which will be set to the entry label in the current iteration.

```
\forglsentries  
178 \newcommand*{\forglsentries}[3][\glsdefaulttype]{%  
179 \edef\@glo@list{\csname glolist\#1\endcsname}{%  
180 \for#2:=\@glo@list\do{%181 \ifthenelse{\equal{#2}{}{}}{#3}}}
```

To iterate through all glossary entries over all glossaries listed in the optional argument (the default is all glossaries) use:

```
\forallglsentries[⟨glossary list⟩]{⟨cmd⟩}{⟨code⟩}
```

Within \forallglsentries, the current glossary type is given by \@@this@glo@.

```
\forallglsentries  
182 \newcommand*{\forallglsentries}[3][\@glo@types]{%  
183 \expandafter\forallglossaries\expandafter[#1]{\@@this@glo@}{%  
184 \forglsentries[\@@this@glo@]{#2}{#3}}}
```

To check to see if a glossary exists use:

```
\ifglossaryexists{⟨type⟩}{⟨true-text⟩}{⟨false-text⟩}
```

where ⟨type⟩ is the glossary's label.

```
\ifglossaryexists  
185 \newcommand{\ifglossaryexists}[3]{%  
186 \ifundefined{glotype@#1@out}{#3}{#2}}
```

To check to see if a glossary entry has been defined use:

```
\ifglsentryexists{⟨label⟩}{⟨true text⟩}{⟨false text⟩}
```

where ⟨label⟩ is the entry's label.

```
\ifglsentryexists
187 \newcommand{\ifglsentryexists}[3]{%
188 @ifundefined{glo@#1@name}{#3}{#2}}
```

To determine if given glossary entry has been used in the document text yet use:

```
\ifglsused{\label}{\true}{\false}
```

where *label* is the entry's label. If true it will do *true text* otherwise it will do *false text*.

```
\ifglsused
189 \newcommand*{\ifglsused}[3]{\ifthenelse{\boolean{glo@#1@flag}}{#2}{#3}}
```

The following two commands will cause an error if the given condition fails:

```
\glsdoifexists{\label}{\code}
```

Generate an error if entry specified by *label* doesn't exists, otherwise do *code*.

```
\glsdoifexists
190 \newcommand{\glsdoifexists}[2]{\ifglsentryexists{#1}{#2}{%
191 \PackageError{glossaries}{Glossary entry '#1' has not been
192 defined.}{You need to define a glossary entry before you
193 can use it.}}
```

```
\glsdoifnoexists{\label}{\code}
```

The opposite: only do second argument if the entry doesn't exists. Generate an error message if it exists.

```
\glsdoifnoexists
194 \newcommand{\glsdoifnoexists}[2]{\ifglsentryexists{#1}{%
195 \PackageError{glossaries}{Glossary entry '#1' has already
196 been defined.}{}}{#2}}
```

5.5 Defining new glossaries

A comma-separated list of glossary names is stored in `@glo@types`. When a new glossary type is created, its identifying name is added to this list. This is used by commands that iterate through all glossaries (such as `\makeglossaries` and `\printglossaries`.)

```
@glo@types
197 \newcommand*{@glo@types}{,}
```

A new glossary type is defined using `\newglossary`. Syntax:

```
\newglossary[<log-ext>]{<name>}{<in-ext>}{<out-ext>} {<title>} [<counter>]
```

where *log-ext* is the extension of the `makeindex` transcript file, *in-ext* is the extension of the glossary input file (read in by `\printglossary` and created by `makeindex`), *out-ext* is the extension of the glossary output file which is read in by `makeindex` (lines are written to this file by the `\glossary` command), *title* is the title of the glossary that is used in `\glossarysection` and *counter* is the default

counter to be used by entries belonging to this glossary. The `makeglossaries` Perl script reads in the relevant extensions from the auxiliary file, and passes the appropriate file names and switches to `makeindex`.)

`\newglossary`

```
198 \newcommand*{\newglossary}[5][glg]{%
199 \ifglossaryexists{#2}{%
200 \PackageError{glossaries}{Glossary type '#2' already exists}{%
201 You can't define a new glossary called '#2' because it already
202 exists}%
203 }{%
```

Add this to the list of glossary types:

```
204 \toks@{#2}\edef\@glo@types{\@glo@types\the\toks@,}%
```

Define a comma-separated list of labels for this glossary type, so that all the entries for this glossary can be reset with a single command. When a new entry is created, its label is added to this list.

```
205 \expandafter\gdef\csname glolist@#2\endcsname{,}%
```

Store details of this new glossary type:

```
206 \expandafter\def\csname @glotype@#2@in\endcsname{#3}%
207 \expandafter\def\csname @glotype@#2@out\endcsname{#4}%
208 \expandafter\def\csname @glotype@#2@title\endcsname{#5}%
209 \protected@write\@auxout{}{\string\@newglossary{#2}{#1}{#3}{#4}}%
```

How to display this entry in the document text (uses `\glsdisplay` and `\glsdisplayfirst` by default). These can be redefined by the user later if required (see `\defglsdisplay` and `\defglsdisplayfirst`)

```
210 \expandafter\gdef\csname gls@#2@display\endcsname{%
211 \glsdisplay}%
212 \expandafter\gdef\csname gls@#2@displayfirst\endcsname{%
213 \glsdisplayfirst}%
```

Find out if the final optional argument has been specified, and use it to set the counter associated with this glossary. (Uses `\glscounter` if no optional argument is present.)

```
214 \@ifnextchar[{@\gls@setcounter{#2}}{\@gls@setcounter{#2}[\glscounter]}}}
```

Only defined new glossaries in the preamble:

```
215 \@onlypreamble{\newglossary}
```

`\@newglossary` is used to specify the file extensions for the `makeindex` input, output and transcript files. It is written to the auxiliary file by `\newglossary`. Since it is not used by L^AT_EX, `\@newglossary` simply ignores its arguments.

`\@newglossary`

```
216 \newcommand*{\@newglossary}[4]{}
```

Store counter to be used for given glossary type (the first argument is the glossary label, the second argument is the name of the counter):

`\@gls@setcounter`

```
217 \def\@gls@setcounter#1[#2]{%
218 \expandafter\def\csname @glotype@#1@counter\endcsname{#2}%
219 }
```

Get counter associated with given glossary (the argument is the glossary label):

```
\@gls@getcounter  
220 \newcommand*{\@gls@getcounter}[1]{%  
221 \csname @glotype@\#1@counter\endcsname}
```

Define the main glossary. This will be the first glossary to be displayed when using `\printglossaries`.

```
222 \newglossary{main}{gls}{glo}{\glossaryname}
```

5.6 Defining new entries

New glossary entries are defined using `\newglossaryentry`. This command requires a label and a key-value list that defines the relevant information for that entry. The definition for these keys follows. Note that the `name`, `description` and `symbol` keys will be sanitized later, depending on the value of the package option `sanitize` (this means that if some of the keys haven't been defined, they can be constructed from the `name` and `description` key before they are sanitized).

The `name` key indicates the name of the term being defined. This is how the term will appear in the glossary. The `name` key is required when defining a new glossary entry.

```
223 \define@key{glossentry}{name}{%  
224 \def\@glo@name{\#1} %  
225 }
```

The `description` key is usually only used in the glossary, but can be made to appear in the text by redefining `\glsdisplay` and `\glsdisplayfirst` (or using `\defglsdisplay` and `\defglsdisplayfirst`), however, you will have to disable the `sanitize` option (using the `sanitize` package option, `sanitize={description=false}`, and protect fragile commands.) The `description` key is required when defining a new glossary entry. (Be careful not to make the description too long, because `makeindex` has a limited buffer. `\@glo@desc` is defined to be a short command to discourage lengthy descriptions for this reason. If you do have a very long description, or if you require paragraph breaks, define a separate command that contains the description, and use it as the value to the `description` key.)

```
226 \define@key{glossentry}{description}{%  
227 \def\@glo@desc{\#1} %  
228 }  
  
229 \define@key{glossentry}{descriptionplural}{%  
230 \def\@glo@descplural{\#1} %  
231 }
```

The `sort` key needs to be sanitized here (the `sort` key is provided for `makeindex`'s benefit, not for use in the document.) The `sort` key is optional when defining a new glossary entry. If omitted, the value is given by `\langle name \rangle \langle description \rangle`.

```
232 \define@key{glossentry}{sort}{%  
233 \def\@glo@sort{\#1} %  
234 \onelevel@sanitize\@glo@sort}
```

The `text` key determines how the term should appear when used in the document (i.e. outside of the glossary). If omitted, the value of the `name` key is used instead.

```

235 \define@key{glossentry}{text}{%
236 \def\@glo@text{\#1}%
237 }

```

The `plural` key determines how the plural form of the term should be displayed in the document. If omitted, the plural is constructed by appending `\glspluralsuffix` to the value of the `text` key.

```

238 \define@key{glossentry}{plural}{%
239 \def\@glo@plural{\#1}%
240 }

```

The `first` key determines how the entry should be displayed in the document when it is first used. If omitted, it is taken to be the same as the value of the `text` key.

```

241 \define@key{glossentry}{first}{%
242 \def\@glo@first{\#1}%
243 }

```

The `firstplural` key is used to set the plural form for first use, in the event that the plural is required the first time the term is used. If omitted, it is constructed by appending `\glspluralsuffix` to the value of the `first` key.

```

244 \define@key{glossentry}{firstplural}{%
245 \def\@glo@firstplural{\#1}%
246 }

```

The `symbol` key is ignored by most of the predefined glossary styles, and defaults to `\relax` if omitted. It is provided for glossary styles that require an associated symbol, as well as a name and description. To make this value appear in the glossary, you need to redefine `\glossaryentryfield` so that it uses its fourth parameter. If you want this value to appear in the text when the term is used by commands like `\gls`, you will need to change `\glsdisplay` and `\glsdisplayfirst` (either explicitly for all glossaries or via `\defglsdisplay` and `\defglsdisplayfirst` for individual glossaries.)

```

247 \define@key{glossentry}{symbol}{%
248 \def\@glo@symbol{\#1}%
249 }

```

```

250 \define@key{glossentry}{symbolplural}{%
251 \def\@glo@symbolplural{\#1}%
252 }

```

The `type` key specifies to which glossary this entry belongs. If omitted, the default glossary is used.

```

253 \define@key{glossentry}{type}{%
254 \def\@glo@type{\#1}}

```

The `counter` key specifies the name of the counter associated with this glossary entry:

```

255 \define@key{glossentry}{counter}{%
256 \G@ifundefined{c@\#1}{\PackageError{glossaries}{There is no counter
257 called '\#1'}{\The counter key should have the name of a valid
258 counter as its value}}{%
259 \def\@glo@counter{\#1}}}

```

Define `\newglossaryentry {⟨label⟩} {⟨key-val list⟩}`. There are two required fields in `⟨key-val list⟩`: `name` and `description`. (See above.)

```

\newglossaryentry
260 \DeclareRobustCommand{\newglossaryentry}[2]{%
    Check to see if this glossary entry has already been defined:
261 \glsdoifnoexists{#1}{%
        Set up defaults. If the name or description keys are omitted, an error will be
        generated.
262 \def\@glo@name{\PackageError{glossaries}{name key required in
263 \string\newglossaryentry}{You haven't specified the entry name}}%
264 \def\@glo@desc{\PackageError{glossaries}{description key required in

269 \def\@glo@symbolplural{\@glo@symbol}%
270 \def\@glo@text{\@glo@name}%
271 \def\@glo@plural{\@glo@text\glspluralsuffix}%
272 \def\@glo@first{\relax}%
273 \def\@glo@firstplural{\relax}%
274 \def\@glo@sortf{\@glo@name}%
275 \def\@glo@counter{\@gls@getcounter{\@glo@type}}%
        Extract key-val information from third parameter:
276 \setkeys{glossentry}{#2}%
    Check to see if this glossary type has been defined, if it has, add this label to the
    relevant list, otherwise generate an error.
277 \Gifundefined{glolist@\@glo@type}{\PackageError{glossaries}{%
278 Glossary type '\@glo@type' has not been defined}{%
279 You need to define a new glossary type, before making entries
280 in it}}{%
281 \protected@edef\glolist@{\csname glolist@\@glo@type\endcsname}%
282 \expandafter\xdef\csname glolist@\@glo@type\endcsname{\@glolist@{#1},}%
283 }%
    Check if first and firstplural have been use. If firstplural hasn't been specified, but
    first has been specified, then form firstplural by appending \glspluralsuffix to
    value of first key, otherwise obtain the value from the plural key.
284 \if\relax\@glo@firstplural\relax%
285     \if\relax\@glo@first\relax%
286         \def\@glo@firstplural{\@glo@plural}%
287         \def\@glo@first{\@glo@text}%
288     \else
289         \def\@glo@firstplural{\@glo@first\glspluralsuffix}%
290     \fi
291 \else
292     \if\relax\@glo@first\relax%
293         \def\@glo@first{\@glo@text}%
294     \fi
295 \fi

```

Define commands associated with this entry:

```

296 \expandafter\protected@xdef\csname glo@#1@text\endcsname{\@glo@text}%
297 \expandafter\protected@xdef\csname glo@#1@plural\endcsname{\@glo@plural}%
298 \expandafter\protected@xdef\csname glo@#1@first\endcsname{\@glo@first}%
299 \expandafter\protected@xdef\csname glo@#1@firstpl\endcsname{\@glo@firstplural}%
300 \expandafter\protected@xdef\csname glo@#1@type\endcsname{\@glo@type}%
301 \expandafter\protected@xdef\csname glo@#1@counter\endcsname{\@glo@counter}%
302 \@gls@sanitizename
303 \expandafter\protected@xdef\csname glo@#1@name\endcsname{\@glo@name}%
304 \@gls@sanitizedesc
305 \expandafter\protected@xdef\csname glo@#1@desc\endcsname{\@glo@desc}%
306 \expandafter\protected@xdef\csname glo@#1@descplural\endcsname{\@glo@descplural}%
307 \expandafter\protected@xdef\csname glo@#1@sort\endcsname{\@glo@sort}%
308 \@gls@sanitizesymbol
309 \expandafter\protected@xdef\csname glo@#1@symbol\endcsname{\@glo@symbol}%
310 \expandafter\protected@xdef\csname glo@#1@symbolplural\endcsname{\@glo@symbolplural}%

```

Define an associated boolean variable to determine whether this entry has been used yet (needs to be defined globally):

```

311 \expandafter\gdef\csname glo@#1@flagfalse\endcsname{%
312 \expandafter\global\expandafter
313 \let\csname ifglo@#1@flag\endcsname\iffalse}%
314 \expandafter\gdef\csname glo@#1@flagtrue\endcsname{%
315 \expandafter\global\expandafter
316 \let\csname ifglo@#1@flag\endcsname\iftrue}%
317 \csname glo@#1@flagfalse\endcsname
318 }%

```

5.7 Resetting and unsetting entry flags

Each glossary entry is assigned a conditional of the form `\ifglo@<label>@flag` which determines whether or not the entry has been used (see also `\ifglsused` defined below.) These flags can be set and unset using the following macros:

The command `\glsreset{<label>}` can be used to set the entry flag to indicate that it hasn't been used yet. The required argument is the entry label.

```
\glsreset
319 \newcommand*{\glsreset}[1]{%
320 \glsdoifexists{#1}{%
321 \expandafter\global\csname glo@#1@flagfalse\endcsname}}}
```

As above, but with only a local effect:

```
\glslocalreset
322 \newcommand*{\glslocalreset}[1]{%
323 \glsdoifexists{#1}{%
324 \expandafter\let\csname ifglo@#1@flag\endcsname\iffalse}}
```

The command `\glsunset{<label>}` can be used to set the entry flag to indicate that it has been used. The required argument is the entry label.

```
\glsunset
325 \newcommand*{\glsunset}[1]{%
326 \glsdoifexists{#1}{%
327 \expandafter\global\csname glo@#1@flagtrue\endcsname}}
```

As above, but with only a local effect:

```
\glslocalunset
328 \newcommand*{\glslocalunset}[1]{%
329 \glsdoifexists{#1}{%
330 \expandafter\let\csname ifglo@#1@flag\endcsname\iftrue}}
```

Reset all entries for the named glossaries (supplied in a comma-separated list).
Syntax: `\glsresetall[⟨glossary-list⟩]`

```
\glsresetall
331 \newcommand*{\glsresetall}[1][\@glo@types]{%
332 \forallglsentries[#1]{\glsentry}{%
333 \glsreset{@glsentry}}}
```

As above, but with only a local effect:

```
\glslocalresetall
334 \newcommand*{\glslocalresetall}[1][\@glo@types]{%
335 \forallglsentries[#1]{\glsentry}{%
336 \glslocalreset{@glsentry}}}
```

Unset all entries for the named glossaries (supplied in a comma-separated list).
Syntax: `\glsunsetall[⟨glossary-list⟩]`

```
\glsunsetall
337 \newcommand*{\glsunsetall}[1][\@glo@types]{%
338 \forallglsentries[#1]{\glsentry}{%
339 \glsunset{@glsentry}}}
```

As above, but with only a local effect:

```
\glslocalunsetall
340 \newcommand*{\glslocalunsetall}[1][\@glo@types]{%
341 \forallglsentries[#1]{\glsentry}{%
342 \glslocalunset{@glsentry}}}
```

5.8 Loading files containing glossary entries

Glossary entries can be defined in an external file. These external files can contain `\newglossaryentry` and `\newacronym` commands.¹⁰

```
\loadglsentries[⟨type⟩]{⟨filename⟩}
```

This command will input the file using `\input`. The optional argument specifies to which glossary the entries should be assigned if they haven't used the `type` key. If the optional argument is not specified, the default glossary is used. Only those entries used in the document (via `\glslink`, `\gls`, `\glspol` and uppercase variants or `\glsadd` and `\glsaddall` will appear in the glossary.) The mandatory argument is the filename (with or without .tex extension.)

¹⁰and any other valid L^AT_EX code that can be used in the preamble.

```

\loadglsentries
343 \newcommand*{\loadglsentries}[2][\@gls@default]{%
344 \let\@gls@default\glsdefaulttype
345 \def\glsdefaulttype{\#1}\input{\#2}%
346 \let\glsdefaulttype\@gls@default}

\loadglsentries can only be used in the preamble:
347 \onlypreamble{\loadglsentries}

```

5.9 Using glossary entries in the text

Any term that has been defined using `\newglossaryentry` (or `\newacronym`) can be displayed in the text (i.e. outside of the glossary) using one of the commands defined in this section. Unless you use `\glslink`, the way the term appears in the text is determined by `\glsdisplayfirst` (if it is the first time the term has been used) or `\glsdisplay` (for subsequent use.) Any formatting commands (such as `\textbf` is governed by `\glstextformat`. By default this just displays the link text “as is”.

```

\glstextformat
348 \newcommand*{\glstextformat}[1]{#1}

```

The first time an entry is used, the way in which it is displayed is governed by `\glsdisplayfirst`. This takes four parameters: #1 will be the value of the entry’s `first` or `firstplural` key, #2 will be the value of the entry’s `description` key, #3 will be the value of the entry’s `symbol` key and #4 is additional text supplied by the final optional argument to commands like `\gls` and `\glspl`. The default is to display the first parameter followed by the additional text.

```

\glsdisplayfirst
349 \newcommand*{\glsdisplayfirst}[4]{#1#4}

```

After the first use, the entry is displayed according to the format of `\glsdisplay`. Again, it takes four parameters: #1 will be the value of the entry’s `text` or `plural` key, #2 will be the value of the entry’s `description` key, #3 will be the value of the entry’s `symbol` key and #4 is additional text supplied by the final optional argument to commands like `\gls` and `\glspl`.

```

\glsdisplay
350 \newcommand*{\glsdisplay}[4]{#1#4}

```

When a new glossary is created it uses `\glsdisplayfirst` and `\glsdisplay` as the default way of displaying its entry in the text. This can be changed for the entries belonging to an individual glossary using `\defglsdisplay` and `\defglsdisplayfirst`.

```
\defglsdisplay[<type>]{<definition>}
```

The glossary type is given by `<type>` (the default glossary if omitted) and `<definition>` should have at most #1, #2, #3 and #4. These represent the same arguments as those described for `\glsdisplay`.

```
\defglsdisplay
351 \newcommand*{\defglsdisplay}[2][\glsdefaulttype]{%
352 \expandafter\def\csname gls@#1@display\endcsname##1##2##3##4{#2}}
353 \defglsdisplayfirst[<type>]{<definition>}
```

The glossary type is given by *<type>* (the default glossary if omitted) and *<definition>* should have at most #1, #2, #3 and #4. These represent the same arguments as those described for `\glsdisplayfirst`.

```
\defglsdisplayfirst
353 \newcommand*{\defglsdisplayfirst}[2][\glsdefaulttype]{%
354 \expandafter\def\csname gls@#1@displayfirst\endcsname##1##2##3##4{#2}}
```

5.9.1 Links to glossary entries

The links to glossary entries all have a first optional argument that can be used to change the format and counter of the associated entry number. Except for `\glslink`, the commands like `\gls` have a final optional argument that can be used to insert additional text in the link (this will usually be appended, but can be redefined using `\defglsdisplay` and `\defglsdisplayfirst`). It goes against the L^AT_EX norm to have an optional argument after the mandatory arguments, but it makes more sense to write, say, `\gls{label}'s` rather than, say, `\gls[append='s]{label}`. Since these control sequences are defined to include the final square bracket, spaces will be ignored after them. This is likely to lead to confusion as most users would not expect, say, `\gls{<label>}` to ignore following spaces, so `\new@ifnextchar` from the `amsgen` package is required.

The following keys can be used in the first optional argument. The `counter` key checks that the value is the name of a valid counter.

```
355 \define@key{glslink}{counter}{%
356 @ifundefined{c@#1}{\PackageError{glossaries}{There is no counter
357 called '#1'}{The counter key should have the name of a valid
358 counter as its value}}{%
359 \def\@gls@counter{#1}}}
```

The value of the `format` key should be the name of a command (without the initial backslash) that has a single mandatory argument which can be used to format the associated entry number.

```
360 \define@key{glslink}{format}{%
361 \def\@glsnumberformat{#1}}
```

The `hyper` key is a boolean key, it can either have the value `true` or `false`, and indicates whether or not to make a hyperlink to the relevant glossary entry. If `hyper` is `false`, an entry will still be made in the glossary, but the given text won't be a hyperlink.

```
362 \define@boolkey{glslink}{hyper}{true}{}{}
```

Syntax:

```
\glslink[<options>]{<label>}{<text>}
```

Display *<text>* in the document, and add the entry information for *<label>* into

the relevant glossary. The optional argument should be a key value list using the `glslink` keys defined above.

There is also a starred version:

```
\glslink*[<options>]{<label>}{<text>}
```

which is equivalent to `\glslink[hyper=false,<options>]{<label>}{<text>}`

First determine whether or not we are using the starred version:

```
\glslink
```

```
363 \newcommand{\glslink}{%
364 \@ifstar\@sgls@link\@gls@link{}}
```

Define the starred version:

```
\@sgls@link
```

```
365 \newcommand*{\@sgls@link}[1][]{\@gls@link[hyper=false,#1]}
```

Define the un-starred version:

```
\@gls@link
```

```
366 \newcommand*{\@gls@link}[3][]{%
367 \glsdoifexists{#2}{%
368 \def\@glsnumberformat{\glsnumberformat}%
369 \edef\@gls@counter{\csname glo@#2@counter\endcsname}%
370 \KV@glslink@hypertrue%
371 \setkeys{glslink}{#1}%
372 \edef\theglsentrycounter{\expandafter\noexpand\csname the\@gls@counter\endcsname}%
373 \ifKV@glslink@hyper%
374 \glslink{glo:#2}{\glstextformat{#3}}%
375 \else%
376 \glstextformat{#3}\relax%
377 \fi%
378 \protected@edef\@glo@sort{\csname glo@#2@sort\endcsname}%
379 \gls@checkmkidxchars\@glo@sort%
380 \protected@edef\@glo@name{\csname glo@#2@name\endcsname}%
381 \gls@checkmkidxchars\@glo@name%
382 \protected@edef\@glo@name{\string\glsnamefont{\@glo@name}}%
383 \protected@edef\@glo@desc{\csname glo@#2@desc\endcsname}%
384 \gls@checkmkidxchars\@glo@desc%
385 \protected@edef\@glo@symbol{\csname glo@#2@symbol\endcsname}%
386 \gls@checkmkidxchars\@glo@symbol%
387 \gls@set@glo@numformat\@glo@numfmt\gls@counter\@glsnumberformat%
388 \glossary[\csname glo@#2@type\endcsname]{%
389 \glo@sort\@gls@actualchar%
390 \string\glossaryentryfield{#2}{\glo@name}{\glo@desc}%
391 }{\glo@symbol}\gls@encapchar\@glo@numfmt}%
392 }}
```

Set the formatting information in the format required by `makeindex`:

```
\@set@glo@numformat
```

```
393 \def\@set@glo@numformat#1#2#3{%
394 \expandafter\@glo@check@mkidxrangechar#3\@nil%
395 \protected@edef#1{\@glo@prefix setentrycounter{#2}}%
```

```

396 \expandafter\string\csname@glo@suffix\endcsname}%
397 \@gls@checkmkidxchars#1}

```

Check to see if the given string starts with a (or). If it does set \glo@prefix to the starting character, and \glo@suffix to the rest (or glsnumberformat if there is nothing else), otherwise set \glo@prefix to nothing and \glo@suffix to all of it.

```

398 \def\@glo@check@mkidxrangechar#1#2\@nil{%
399 \if#1(\relax
400   \def\@glo@prefix{}%
401   \if\relax#2\relax
402     \def\@glo@suffix{glsnumberformat}%
403   \else
404     \def\@glo@suffix{#2}%
405   \fi
406 \else
407   \if#1)\relax
408     \def\@glo@prefix{}%
409   \if\relax#2\relax
410     \def\@glo@suffix{glsnumberformat}%
411   \else
412     \def\@glo@suffix{#2}%
413   \fi
414 \else
415   \def\@glo@prefix{}\def\@glo@suffix{#1#2}%
416   \fi
417 \fi}

```

Catch makeindex special characters:

```

\@gls@checkmkidxchars
418 \newcommand{\@gls@checkmkidxchars}[1]{%
419 \def\@gls@checkedmkidx{}%
420 \expandafter\@gls@checkquote#1\@nil""\null%
421 \expandafter\@gls@updatechecked\@gls@checkedmkidx{#1}%

```

```

629   \gdef\@glstarget#1#2{#2}%
630 }{%
631   \gdef\@glstarget#1#2{\hypertarget{#1}{#2}}}

```

Glossary hyperlinks can be disabled using `\glsdisablehyper` (effect can be localised):

```
\glsdisablehyper
632 \newcommand{\glsdisablehyper}{%
633 \renewcommand*\@glslink[2]{##2}%
634 \renewcommand*\@glstarget[2]{##2}}
```

Glossary hyperlinks can be enabled using `\glsenablehyper` (effect can be localised):

```
\glsenablehyper
635 \newcommand{\glsenablehyper}{%
636 \renewcommand*\@glslink[2]{\hyperlink{##1}{##2}}%
637 \renewcommand*\@glstarget[2]{\hypertarget{##1}{##2}}}
```

Syntax:

```
\gls[<options>]{<label>}[<insert text>]
```

Link to glossary entry using singular form. The link text is taken from the value of the `text` or `first` keys used when the entry was defined.

The first optional argument is a key-value list, the same as `\glslink`, the mandatory argument is the entry label. After the mandatory argument, there is another optional argument to insert extra text in the link text (the location of the inserted text is governed by `\glsdisplay` and `\glsdisplayfirst`). As with `\glslink` there is a starred version which is the same as the unstarred version but with the `hyper` key set to `false`. (Additional options can also be specified in the first optional argument.)

First determine if we are using the starred form:

```
\gls
638 \newcommand*{\gls}{\@ifstar\@sgls\@gls}
```

Define the starred form:

```
\@sgls
639 \newcommand*{\@sgls}[1][]{\@gls[hyper=false,#1]}
```

Defined the un-starred form. Need to determine if there is a final optional argument

```
\@gls
640 \newcommand*{\@gls}[2][]{%
641 \new@ifnextchar[\{\@gls@{#1}{#2}\}{\@gls@{#1}{#2}[]}}}
```

Read in the final optional argument:

```
642 \def\@gls@#1#2[#3]{%
643 \glsdoifexists{#2}{\edef\@glo@type{\glsentrytype{#2}}}{%
```

```

Save options in \@gls@link@opts and label in \@gls@link@label
644 \def\@gls@link@opts{\#1}%
645 \def\@gls@link@label{\#2}%
Determine what the link text should be (this is stored in \@glo@text)
646 \ifglsused{\#2}{\protected@edef\@glo@text{%
647 \csname gls@\@glo@type @display\endcsname

\Glssymbolplural
1058 \newcommand*{\Glssymbolplural}{\@ifstar@sGlssymbolplural@\Glssymbolplural}

    Define the starred form:
1059 \newcommand*{\sGlssymbolplural}[1][]{\@Glssymbolplural[hyper=false,#1]}

    Defined the un-starred form. Need to determine if there is a final optional argument
1060 \newcommand*{\@Glssymbolplural}[2][]{%
1061 \new@ifnextchar[{\@Glssymbolplural@{\#1}{\#2}}]{\@Glssymbolplural@{\#1}{\#2}[]}{}

    Read in the final optional argument:
1062 \def \@Glssymbolplural@#1#2[#3]{%
1063 \glsdoifexists{\#2}{\edef@glo@type{\glsentrytype{\#2}}}{}

    Determine what the link text should be (this is stored in \glo@text)
1064 \protected@edef@glo@text{\glsentrysymbolplural{\#2}}{%

    Call \gls@link
1065 \gls@link[#1]{\#2}{%
1066     \expandafter\makefirstuc\expandafter{\glo@text}\#3}%
1067 }%
1068 }

    \GLSsymbolplural behaves like \glssymbolplural except that the link text is converted to uppercase.
```

```
\GLSsymbolplural
1069 \newcommand*{\GLSsymbolplural}{\@ifstar@sGLSsymbolplural@\GLSsymbolplural}

    Define the starred form:
1070 \newcommand*{\sGLSsymbolplural}[1][]{\@GLSsymbolplural[hyper=false,#1]}

    Defined the un-starred form. Need to determine if there is a final optional argument
1071 \newcommand*{\@GLSsymbolplural}[2][]{%
1072 \new@ifnextchar[{\@GLSsymbolplural@{\#1}{\#2}}]{\@GLSsymbolplural@{\#1}{\#2}[]}{}

    Read in the final optional argument:
1073 \def \@GLSsymbolplural@#1#2[#3]{%
1074 \glsdoifexists{\#2}{\edef@glo@type{\glsentrytype{\#2}}}{}

    Determine what the link text should be (this is stored in \glo@text)
1075 \protected@edef@glo@text{\glsentrysymbolplural{\#2}}{%

    Call \gls@link
1076 \gls@link[#1]{\#2}{\MakeUppercase{\glo@text\#3}}{%
1077 }%
1078 }
```

5.9.2 Displaying entry details without adding information to the glossary

These commands merely display entry information without adding entries in the associated file or having hyperlinks.

Get the entry name (as specified by the `name` key when the entry was defined.) The argument is the label associated with the entry. Note that unless you used `name=false` in the `sanitize` package option you may get unexpected results if the `name` key contains any commands.

```
\glsentryname
1079 \newcommand*{\glsentryname}[1]{\csname glo@#1@name\endcsname}

\Glsentryname
1080 \newcommand*{\Glsentryname}[1]{%
1081 \protected@edef{\glo@text{\csname glo@#1@name\endcsname}}{%
1082 \expandafter\makefirstuc\expandafter{\glo@text}}}
```

Get the entry description (as specified by the `description` when the entry was defined.) The argument is the label associated with the entry. Note that unless you used `description=false` in the `sanitize` package option you may get unexpected results if the `description` key contained any commands.

```
\glsentrydesc
1083 \newcommand*{\glsentrydesc}[1]{\csname glo@#1@desc\endcsname}

\Glsentrydesc
1084 \newcommand*{\Glsentrydesc}[1]{%
1085 \protected@edef{\glo@text{\csname glo@#1@desc\endcsname}}{%
1086 \expandafter\makefirstuc\expandafter{\glo@text}}}
```

Plural form:

```
\glsentrydescplural
1087 \newcommand*{\glsentrydescplural}[1]{%
1088 \csname glo@#1@descplural\endcsname}

\Glsentrydescplural
1089 \newcommand*{\Glsentrydescplural}[1]{%
1090 \protected@edef{\glo@text{\csname glo@#1@descplural\endcsname}}{%
1091 \expandafter\makefirstuc\expandafter{\glo@text}}}
```

Get the entry text, as specified by the `text` key when the entry was defined. The argument is the label associated with the entry:

```
\glsentrytext
1092 \newcommand*{\glsentrytext}[1]{\csname glo@#1@text\endcsname}

\Glsentrytext
1093 \newcommand*{\Glsentrytext}[1]{%
1094 \protected@edef{\glo@text{\csname glo@#1@text\endcsname}}{%
1095 \expandafter\makefirstuc\expandafter{\glo@text}}}
```

Get the plural form:

```

\glsentryplural
1096 \newcommand*{\glsentryplural}[1]{\csname glo@#1@plural\endcsname}

\Glsentryplural
1097 \newcommand*{\Glsentryplural}[1]{%
1098 \protected@edef{\glo@text{\csname glo@#1@plural\endcsname}}{%
1099 \expandafter\makefirststuc\expandafter{\glo@text}}}

Get the symbol associated with this entry. The argument is the label associated
with the entry. Note that unless you used symbol=false in the sanitize package
option you may get unexpected results if the symbol key contained any commands.

\glsentrysymbol
1100 \newcommand*{\glsentrysymbol}[1]{\csname glo@#1@symbol\endcsname}

\Glsentrysymbol
1101 \newcommand*{\Glsentrysymbol}[1]{%
1102 \protected@edef{\glo@text{\csname glo@#1@symbol\endcsname}}{%
1103 \expandafter\makefirststuc\expandafter{\glo@text}}}

Plural form:

\glsentrysymbolplural
1104 \newcommand*{\glsentrysymbolplural}[1]{%
1105 \csname glo@#1@symbolplural\endcsname}

\Glsentrysymbolplural
1106 \newcommand*{\Glsentrysymbolplural}[1]{%
1107 \protected@edef{\glo@text{\csname glo@#1@symbolplural\endcsname}}{%
1108 \expandafter\makefirststuc\expandafter{\glo@text}}}

Get the entry text to be used when the entry is first used in the document (as
specified by the first key when the entry was defined.)

\glsentryfirst
1109 \newcommand*{\glsentryfirst}[1]{\csname glo@#1@first\endcsname}

\Glsentryfirst
1110 \newcommand*{\Glsentryfirst}[1]{%
1111 \protected@edef{\glo@text{\csname glo@#1@first\endcsname}}{%
1112 \expandafter\makefirststuc\expandafter{\glo@text}}}

Get the plural form (as specified by the firstplural key when the entry was
defined.)

\glsentryfirstplural
1113 \newcommand*{\glsentryfirstplural}[1]{%
1114 \csname glo@#1@firstpl\endcsname}

\Glsentryfirstplural
1115 \newcommand*{\Glsentryfirstplural}[1]{%
1116 \protected@edef{\glo@text{\csname glo@#1@firstpl\endcsname}}{%
1117 \expandafter\makefirststuc\expandafter{\glo@text}}}

```

Display the glossary type with which this entry is associated (as specified by the `type` key used when the entry was defined)

```
\glsentrytype  
1118 \newcommand*{\glsentrytype}[1]{\csname glo@#1@type\endcsname}
```

Display the sort text used for this entry. Note that the `sort` key is sanitized, so unexpected results may occur if the `sort` key contained commands.

```
\glsentrysort  
1119 \newcommand*{\glsentrysort}[1]{\csname glo@#1@sort\endcsname}
```

5.10 Adding an entry to the glossary without generating text

The following keys are provided for `\glsadd` and `\glsaddall`:

```
1120 \define@key{glossadd}{counter}{\def@glo@counter{#1}}  
1121 \define@key{glossadd}{format}{\def@glo@format{#1}}
```

This key is only used by `\glsaddall`:

```
1122 \define@key{glossadd}{types}{\def@glo@type{#1}}
```

```
\glsadd[<options>]{<label>}
```

Add a term to the glossary without generating any link text. The optional argument indicates which counter to use, and how to format it (using a key-value list) the second argument is the entry label. Note that `<options>` only has two keys: `counter` and `format` (the `types` key will be ignored).

```
\glsadd  
1123 \newcommand*{\glsadd}[2][]{%  
1124 \glsdoifexists{#2}{%  
1125 \def@glo@format{glsnumberformat} %  
1126 \edef@glo@counter{\csname glo@#2@counter\endcsname} %  
1127 \setkeys{glossadd}{#1} %  
1128 \edef\theglsentrycounter{\expandafter\noexpand\csname the@glo@counter\endcsname} %  
1129 \protected@edef@glo@sort{\csname glo@#2@sort\endcsname} %  
1130 \@gls@checkmkidxchars@glo@sort  
1131 \protected@edef@@glo@name{\csname glo@#2@name\endcsname} %  
1132 \@gls@checkmkidxchars@@glo@name  
1133 \protected@edef@glo@name{\string\glsnamefont{\@@glo@name}} %  
1134 \protected@edef@glo@desc{\csname glo@#2@desc\endcsname} %  
1135 \@gls@checkmkidxchars@glo@desc  
1136 \protected@edef@glo@symbol{\csname glo@#2@symbol\endcsname} %  
1137 \@gls@checkmkidxchars@glo@symbol  
1138 \cset@glo@numformat@glo@numfmt@glo@counter@glo@format  
1139 \glossary[\csname glo@#2@type\endcsname]{%  
1140 \@glo@sort@gls@actualchar\string\glossaryentryfield  
1141 {#2}{@\glo@name}{@\glo@desc}{@\glo@symbol}{@\gls@encapchar  
1142 @glo@numfmt} %  
1143 }}
```

```
\glsaddall[<glossary list>]
```

Add all terms defined for the listed glossaries (without displaying any text.) If types key is omitted, apply to all glossary types.

```
\glsaddall
1144 \newcommand*{\glsaddall}[1][]{%
1145 \def\@glo@type{\@glo@types}%
1146 \setkeys{glossadd}{#1}%
1147 \forallglsentries[\@glo@type]{\@glo@entry}{}%
1148 \glsadd[#1]{\@glo@entry}}%
1149 }
```

5.11 Creating associated files

The `\writeist` command creates the associated customized `.ist makeindex` style file. While defining this command, some characters have their catcodes temporarily changed to ensure they get written to the `.ist` file correctly. The `makeindex` actual character (usually `\@`) is redefined to be a `?`, to allow internal commands to be written to the glossary file output file.

The special characters are stored in `\@gls@actualchar`, `\@gls@encapchar`, `\@gls@levelchar` and `\@gls@quotechar` to make them easier to use later, but don't change these values, because the characters are encoded in the command definitions that are used to escape the special characters (which means that the user no longer needs to worry about `makeindex` special characters.)

The symbols and numbers label for group headings are hardwired into the `.ist` file as `glssymbols` and `glsnumbers`, the group titles can be translated (so that `\glssymbolsgroupname` replaces `glssymbols` and `\glsnumbersgroupname` replaces `glsnumbers`) using the command `\glsgetgroupname` which is defined in `glossary-hypernav`. This is done to prevent any problem characters in `\glssymbolsgroupname` and `\glsnumbersgroupname` from breaking hyperlinks.

Some of these lines are too long to fit on the page, but as I have temporarily disabled the comment character, I can't split the lines. If you want to see the code in full, have a look at `glossaries.sty`.

```
\writeist
1150 \newwrite\istfile
1151 \bgroup
1152 \catcode`\%12\relax
1153 \catcode`\"12\relax
1154 \catcode`\|12\relax
1155 \catcode`\!12\relax
1156 \catcode`\?12\relax
1157 \gdef\@gls@actualchar{?}
1158 \gdef\@gls@encapchar{|}
1159 \gdef\@gls@levelchar{!}
1160 \gdef\@gls@quotechar{"}
1161 \gdef\writeist{\relax
1162 \protected@write\@auxout{}{\string\@istfilename{\istfilename}}
1163 \openout\istfile=\istfilename
1164 \write\istfile{\% makeindex style file created by the glossaries package}
1165 \write\istfile{\% for document '\jobname' on \the\year-\the\month-\the\day}
1166 \write\istfile{actual '\@gls@actualchar'}
1167 \write\istfile{encap '\@gls@encapchar'}
```

```

1168 \write\istfile{level '\@gls@levelchar'}
1169 \write\istfile{quote '\@gls@quotechar'}
1170 \write\istfile{keyword "\string\\glossaryentry"}
1171 \write\istfile{preamble "\string\\glossarysection[\string\\glossarytoctitle]\{\string\\glossarypostamble]"
1172 \write\istfile{postamble "\string\n\string\\end{theglossary}\string\n\string\\glossarypostamble"
1173 \write\istfile{group_skip "\string\\glsgroupskip\string\n"}
1174 \write\istfile{item_0 "\string\n"}
1175 \write\istfile{delim_0 "\{\string\\glossaryentrynumbers\{\string\\relax "
1176 \write\istfile{delim_t "\}\}\}"
1177 \write\istfile{delim_n "\string\\delimN "}
1178 \write\istfile{delim_r "\string\\delimR "}
1179 \write\istfile{headings_flag 1}
1180 \write\istfile{heading_prefix "\string\\glsgroupheading\{"}
1181 \write\istfile{heading_suffix "\}"}
1182 \write\istfile{symhead_positive "glssymbols"}
1183 \write\istfile{numhead_positive "glsnumbers"}
1184 \write\istfile{page_compositor "\glscompositor"}
1185 \noist}
1186 \egroup

```

The command `\noist` will suppress the creation of the `.ist` file (it simply redefines `\writeist` to do nothing.) Obviously you need to use this command before `\writeist` to have any effect. Since the `.ist` file should only be created once, `\noist` is called at the end of `\writeist`.

```
\noist
1187 \newcommand{\noist}{\let\writeist\relax}
```

`\@makeglossary` is an internal command that takes an argument indicating the glossary type. This command will create the glossary file required by `makeindex` for the given glossary type, using the extension supplied by the `<out-ext>` parameter used in `\newglossary` (and it will also activate the `\glossary` command, and create the customized `.ist` `makeindex` style file.)

Note that you can't use `\@makeglossary` for only some of the defined glossaries. You either need to have a `\makeglossary` for all glossaries or none (otherwise you will end up with a situation where TeX is trying to write to a non-existent file.) The relevant glossary must be defined prior to using `\@makeglossary`.

```
\@makeglossary
1188 \newcommand*{\@makeglossary}[1]{%
1189 \ifglossaryexists{#1}{%
1190 \edef\glo@out{\csname @glotype@#1@out\endcsname}%
1191 \expandafter\newwrite\csname glo@#1@file\endcsname%
1192 \edef@\glo@file{\csname glo@#1@file\endcsname}%
1193 \immediate\openout@\glo@file=\jobname.\glo@out
1194 \@gls@renewglossary
1195 \PackageInfo{glossaries}{Writing glossary file \jobname.\glo@out}
1196 \writeist
1197 }{\PackageError{glossaries}{%
1198 Glossary type '#1' not defined}{New glossaries must be defined before
1199 using \string\makeglossary}}}
```

`\makeglossaries` will use `\@makeglossary` for each glossary type that has been defined. New glossaries need to be defined before using `\makeglossary`,

so have `\makeglossaries` redefine `\newglossary` to prevent it being used afterwards.

```
\makeglossaries
1200 \newcommand*{\makeglossaries}{%
1201 \@for\@glo@type:=\@glo@types\do{%
1202 \ifthenelse{\equal{\@glo@type}{} }{}{%
1203 \makeglossary{\@glo@type}}}}%
1204 \renewcommand*\newglossary[4][]{%
1205 \PackageError{glossaries}{New glossaries
1206 must be created before \string\makeglossaries}{You need
1207 to move \string\makeglossaries\space after all your
1208 \string\newglossary\space commands}}%
1209 \let\@makeglossary\empty
1210 \let\makeglossary\empty}
```

The `\makeglossary` command is redefined to be identical to `\makeglossaries`. (This is done to reinforce the message that you must either use `\@makeglossary` for all the glossaries or for none of them.)

```
\makeglossary
1211 \let\makeglossary\makeglossaries
```

5.12 Writing information to associated files

The `\glossary` command is redefined so that it takes an optional argument `type` to specify the glossary type (use `\glsdefaulttype` glossary by default). This shouldn't be used at user level as `\glslink` sets the correct format. The associated number should be stored in `\the\glstentrycounter` before using `\glossary`.

```
\glossary
1212 \renewcommand*{\glossary}[1][\glsdefaulttype]{%
1213 \@glossary[#1]}
```

Define internal `\@glossary` to ignore its argument. This gets redefined in `\@makeglossary`.

```
\@glossary
1214 \def\@glossary[#1]{\@bsphack\begingroup\@sanitize\@index}
```

This is a convenience command to set `\@glossary`. It is used by `\@makeglossary` and then redefined to do nothing, as it only needs to be done once.

```
@gls@renewglossary
1215 \newcommand{\@gls@renewglossary}{%
1216 \gdef\@glossary[##1]{\@bsphack\begingroup\@wrglossary{##1}}%
1217 \let\@gls@renewglossary\empty
1218 }
```

The `\@wrglossary` command is redefined to have two arguments. The first argument is the glossary type, the second argument is the glossary entry (the format of which is set in `\glslink`.)

```
\@wrglossary
1219 \renewcommand*{\@wrglossary}[2]{%
1220 \expandafter\protected@write\csname glo@#1@file\endcsname{}{%
1221 \string\glossaryentry[#2]{\the\lsentrycounter}}}\endgroup\@esphack}
```

5.13 Displaying the glossary

An individual glossary is displayed in the text using `\printglossary[key-val list]`. If the type key is omitted, the default glossary is displayed. The optional argument can be used to specify an alternative glossary, and can also be used to set the style, title and entry in the table of contents. Available keys are defined below.

```
\printglossary
1222 \newcommand*{\printglossary}[1][type=\glsdefaulttype]{%
1223 \def\@glo@type{\glsdefaulttype}%
1224 \def\glossarytitle{\csname @glotype@\@glo@type @title\endcsname}%
1225 \def\glossarytoctitle{\glossarytitle}%
1226 \def@glossarystyle{}%
1227 \bgroup%
1228 \setkeys{printgloss}{#1}%
1229 \glossarystyle%
1230 \makeatletter%
1231 \@input{\jobname.\csname @glotype@\@glo@type @in\endcsname}%
1232 \egroup%
1233 }
```

The `\printglossaries` command will do `\printglossary` for each glossary type that has been defined. It is better to use `\printglossaries` rather than individual `\printglossary` commands to ensure that you don't forget any new glossaries you may have created. It also makes it easier to chop and change the value of the `acronym` package option. However, if you want to list the glossaries in a different order, or if you want to set the title or table of contents entry, or if you want to use different glossary styles for each glossary, you will need to use `\printglossary` explicitly for each glossary type.

```
\printglossaries
1234 \newcommand*{\printglossaries}{%
1235 \forall\glossaries{\@glo@type}{\printglossary[type=\@glo@type]}}
```

The keys that can be used in the optional argument to `\printglossary` are as follows: The `type` key sets the glossary type.

```
1236 \define@key{printgloss}{type}{\def\@glo@type{#1}}
```

The `title` key sets the title used in the glossary section header. This overrides the title used in `\newglossary`.

```
1237 \define@key{printgloss}{title}{\def\glossarytitle{#1}}
```

The `toctitle` sets the text used for the relevant entry in the table of contents.

```
1238 \define@key{printgloss}{toctitle}{\def\glossarytoctitle{#1}}
```

The `style` key sets the glossary style (but only for the given glossary.)

```
1239 \define@key{printgloss}{style}{%
1240 \@ifundefined{@glsstyle@#1}{\PackageError{glossaries}{Glossary}}
```

```

1241 style '#1' undefined}{}{%
1242 \def\@glossarystyle{\csname @glsstyle@\#1\endcsname}}

```

The `numberedsection` key determines if this glossary should be in a numbered section.

```

1243 \define@choicekey{printgloss}{numberedsection}[\val\nr]{%
1244 false,nolabel,autolabel][nolabel]{%
1245 \ifcase\nr\relax
1246 \renewcommand*\@@glossarysecstar}{*}%
1247 \renewcommand*\@@glossaryseclabel}{}
1248 \or
1249 \renewcommand*\@@glossarysecstar}{}%
1250 \renewcommand*\@@glossaryseclabel}{}
1251 \or
1252 \renewcommand*\@@glossarysecstar}{}%
1253 \renewcommand*\@@glossaryseclabel}{\label{\glsautoprefix\glo@type}}%
1254 \fi}

```

The `nonumberlist` key determines if this glossary should have a number list.

```

1255 \define@boolkey{printgloss}[gls]{nonumberlist}[true]{%
1256 \ifglsnonumberlist
1257 \def\glossaryentrynumbers##1{}%
1258 \else
1259 \def\glossaryentrynumbers##1{##1}%
1260 \fi}

```

`theglossary` If the `theglossary` environment has already been defined, a warning will be issued. This environment should be redefined by glossary styles.

```

1261 \@ifundefined{theglossary}{%
1262 \newenvironment{theglossary}{}{}{%
1263 \PackageWarning{glossaries}{overriding 'theglossary' environment}%
1264 \renewenvironment{theglossary}{}{}}

```

The glossary header is given by `\glossaryheader`. This forms part of the glossary style, and must indicate what should appear immediately after the start of the `theglossary` environment. (For example, if the glossary uses a tabular-like environment, it may be used to set the header row.) Note that if you don't want a header row, the glossary style must redefine `\glossaryheader` to do nothing.

```

\glossaryheader
1265 \newcommand*{\glossaryheader}{}{%
\glossaryentryfield{\label}{\name}{\description}{\symbol}{\pagelist}}

```

This command governs how each entry row should be formatted in the glossary. Glossary styles need to redefine this command. Most of the predefined styles ignore `\symbol`.

```

\glossaryentryfield
1266 \newcommand*{\glossaryentryfield}[5]{%
1267 \gls@target{\glo:#1}{\#2} \#4 \#3. \#5\par}

```

Within each glossary, the entries form 28 distinct groups which are determined by the first character of the `sort` key. There will be a maximum of 28 groups: symbols, numbers, and the 26 alphabetical groups A, ..., Z. The command

`\glsgroupskip` specifies what to do between glossary groups. Glossary styles must redefine this command. (Note that `\glsgroupskip` only occurs between groups, not at the start or end of the glossary.)

```
\glsgroupskip
1268 \newcommand*{\glsgroupskip}{}%
```

Each of the 28 glossary groups described above is preceded by a group heading. This is formatted by the command `\glsgroupheading` which takes one argument which is the *label* assigned to that group (not the title). The corresponding labels are: `glossymbols`, `glsnumbers`, `A`, ..., `Z`. Glossary styles must redefine this command. (In between groups, `\glsgroupheading` comes immediately after `\glsgroupskip`.)

```
\glsgroupheading
1269 \newcommand*{\glsgroupheading}[1]{}%
```

It is possible to “trick” `makeindex` into treating entries as though they belong to the same group, even if the terms don’t start with the same letter, by modifying the `sort` key. For example, all entries belonging to one group could be defined so that the `sort` key starts with an `a`, while entries belonging to another group could be defined so that the `sort` key starts with a `b`, and so on. If you want each group to have a heading, you would then need to modify the translation control sequences `\glsgrouptitle` and `\glsgrouplabel` so that the label is translated into the required title (and vice-versa.)

`\glsgrouptitle{<label>}`

This command produces the title for the glossary group whose label is given by `<label>`. By default, the group labelled `glossymbols` produces `\glossymbolsgroupname`, the group labelled `glsnumbers` produces `\glsnumbersgroupname` and all the other groups simply produce their label. As mentioned above, the group labels are: `glossymbols`, `glsnumbers`, `A`, ..., `Z`. If you want to redefine the group titles, you will need to redefine this command.

```
\glsgrouptitle
1270 \newcommand*{\glsgrouptitle}[1]{%
1271 \c@ifundefined{\#1groupname}{\#1}{\csname #1groupname\endcsname}}
```

`\glsgrouplabel{<title>}`

This command does the reverse to the previous command. The argument is the group title, and it produces the group label. Note that if you redefine `\glsgrouptitle`, you will also need to redefine `\glsgrouplabel`.

```
\glsgrouplabel
1272 \newcommand*{\glsgrouplabel}[1]{%
1273 \ifthenelse{\equal{\#1}{\glossymbolsgroupname}}{\glossymbols}{%
1274 \ifthenelse{\equal{\#1}{\glsnumbersgroupname}}{\glsnumbers}{#1}}}
```

The command `\setentrycounter` sets the entry’s associated counter (required by `\glshypernumber` etc.) `\glslink` and `\glsadd` encode the `\glossary` argument so that the relevant counter is set prior to the formatting command.

```
\setentrycounter
1275 \newcommand*{\setentrycounter}[1]{\def\glsentrycounter{#1}}
The current glossary style can be set using \glossarystyle{<style>}.
```

```
\glossarystyle
1276 \newcommand*{\glossarystyle}[1]{%
1277 \@ifundefined{glsstyle@#1}{\PackageError{glossaries}{Glossary
1278 style '#1' undefined}{}}
1279 \csname glsstyle@#1\endcsname}
```

New glossary styles can be defined using:

```
\newglossarystyle{<name>}{<definition>}
```

The *<definition>* argument should redefine `\glossary`, `\glossaryheader`, `\glossarygroupheading`, `\glossaryentryfield` and `\glossarygroupskip` (see [subsection 5.16](#) for the definitions of predefined styles.) Glossary styles should not redefine `\glossarypreamble` and `\glossarypostamble`, as the user should be able to switch between styles without affecting the pre- and postambles.

```
\newglossarystyle
1280 \newcommand*{\newglossarystyle}[2]{%
1281 \@ifundefined{glsstyle@#1}{%
1282 \expandafter\def\csname glsstyle@#1\endcsname{#2}}{%
1283 \PackageError{glossaries}{Glossary style '#1' is already defined}}}
```

Glossary entries are encoded so that the second argument to `\glossaryentryfield` is always specified as `\glsnamefont{<name>}`. This allows the user to change the font used to display the name term without having to redefine `\glossaryentryfield`. The default uses the surrounding font, so in the list type styles (which place the name in the optional argument to `\item`) the name will appear in bold.

```
\glsnamefont
1284 \newcommand*{\glsnamefont}[1]{#1}
```

Each glossary entry has an associated number list (usually page numbers) that indicate where in the document the entry has been used. The format for these number lists can be changed using the `format` key in commands like `\glslink`. The default format is given by `\glshypernumber`. This takes a single argument which may be a single number, a number range or a number list. The number ranges are delimited with `\delimR`, the number lists are delimited with `\delimN`.

If the document doesn't have hyperlinks, the numbers can be displayed just as they are, but if the document supports hyperlinks, the numbers should link to the relevant location. This means extracting the individual numbers from the list or ranges. The `hyperref` package does this with the `\hyperpage` command, but this is encoded for comma and dash delimiters and only for the page counter, but this code needs to be more general. So I have adapted the code used in the `hyperref` package.

```
\glshypernumber
1285 \@ifundefined{hyperlink}{%
1286 \def\glshypernumber#1{#1}}{%
```

```

1287 \def\glshypernumber#1{%
1288 \@delimR#1\delimR\delimR\{}%

```

\@delimR displays a range of numbers for the counter whose name is given by \@gls@counter (which must be set prior to using \glshypernumber.)

\@delimR

```

1289 \def\@delimR#1\delimR #2\delimR #3\\{%
1290 \ifx\\#2\\%
1291   \@delimN{#1}%
1292 \else
1293   \@gls@numberlink{#1}\delimR\@gls@numberlink{#2}%
1294 \fi}

```

\@delimN displays a list of individual numbers, instead of a range:

\@delimN

```

1295 \def\@delimN#1{\@@delimN#1\delimN \delimN\}%
1296 \def\@@delimN#1\delimN #2\delimN#3\\{%
1297 \ifx\\#3\\%
1298   \@gls@numberlink{#1}%
1299 \else
1300   \@gls@numberlink{#1}\delimN\@gls@numberlink{#2}%
1301 \fi
1302 }

```

The following code is modified from hyperref's \HyInd@pagelink where the name of the counter being used is given by \@gls@counter.

```

1303 \def\@gls@numberlink#1{%
1304 \begingroup
1305   \toks@={}%
1306   \@gls@removespaces#1 \@nil
1307 \endgroup}

1308 \def\@gls@removespaces#1 #2\@nil{%
1309   \toks@=\expandafter{\the\toks@#1}%
1310   \ifx\\#2\\%
1311     \edef\x{\the\toks@}%
1312     \ifx\x\empty
1313       \else
1314         \hyperlink{\glsentrycounter.\the\toks@}{\the\toks@}%
1315       \fi
1316     \else
1317       \@gls@ReturnAfterFi%
1318       \@gls@removespaces#2\@nil
1319     }%
1320   \fi
1321 }
1322 \long\def\@gls@ReturnAfterFi#1\fi{\fi#1}

```

The following commands will switch to the appropriate font, and create a hyperlink, if hyperlinks are supported. If hyperlinks are not supported, they will just display their argument in the appropriate font.

\hyperrm

```

1323 \newcommand*{\hyperrm}[1]{\textrm{\glshypernumber{#1}}}

```

```

\hypersf
1324 \newcommand*{\hypersf}[1]{\textsf{\glshypernumber{#1}}}

\hypertt
1325 \newcommand*{\hypertt}[1]{\texttt{\glshypernumber{#1}}}

\hyperbf
1326 \newcommand*{\hyperbf}[1]{\textbf{\glshypernumber{#1}}}

\hypermd
1327 \newcommand*{\hypermd}[1]{\textmd{\glshypernumber{#1}}}

\hyperit
1328 \newcommand*{\hyperit}[1]{\textit{\glshypernumber{#1}}}

\hypersl
1329 \newcommand*{\hypersl}[1]{\textsl{\glshypernumber{#1}}}

\hyperup
1330 \newcommand*{\hyperup}[1]{\textup{\glshypernumber{#1}}}

\hypersc
1331 \newcommand*{\hypersc}[1]{\textsc{\glshypernumber{#1}}}

\hyperemph
1332 \newcommand*{\hyperemph}[1]{\emph{\glshypernumber{#1}}}

```

5.14 Acronyms

If the `acronym` package option is used, a new glossary called `acronym` is created

```

1333 \ifglsacronym
1334   \newglossary[alg]{acronym}{acr}{acn}{\acronymname}
      and \acronymtype is set to the name of this new glossary.
1335   \renewcommand{\acronymtype}{acronym}

```

In the event that the user redefines `\glsdisplay` and `\glsdisplayfirst`, the relevant commands for the new acronym glossary are set to match the format given by `\newacronym`. If you redefine `\newacronym` you may need to set these to something else.

```

1336   \defglsdisplay[acronym]{#1#4}
1337   \defglsdisplayfirst[acronym]{#1#4}
1338 \fi

\newacronym[<key-val list>]{<label>}{<abbrev>}{<long>}

```

This is a quick way of defining acronyms, all it does is call `\newglossaryentry` with the appropriate values. It sets the glossary type to `\acronymtype` which will be `acronym` if the package option `acronym` has been used, otherwise it will be the default glossary. Since `\newacronym` merely calls `\newglossaryentry`, the acronym is treated like any other glossary entry.

If you prefer a different format, you can redefine `\newacronym` as required. The optional argument can be used to override any of the settings.

```

\newacronym
1339 \newcommand{\newacronym}[4] []{%
1340 \newglossaryentry[#2]{type=\acronymtype,%
1341 name=#3,description=#4, text=#3,%
1342 descriptionplural={#4\acrpluralsuffix},%
1343 first={#4 (#3)},plural={#3\acrpluralsuffix},%
1344 firstplural={\@glo@descplural\space (\@glo@plural)},%
1345 #1}}

```

Set up some convenient short cuts. These need to be changed if `\newacronym` is changed (or if the `description` key is changed).

`\acrpluralsuffix` Plural suffix used by `\newacronym`. This just defaults to `\glspluralsuffix` but is changed to include `\textup` if the `smallcaps` option is used, so that the suffix doesn't appear in small caps as it doesn't look right. For example, ABCS looks as though the "s" is part of the acronym, but ABCs looks as though the "s" is a plural suffix. Since the entire text `abcs` is set in `\textsc`, `\textup` is needed to cancel it out.

```
1346 \newcommand*{\acrpluralsuffix}{\glspluralsuffix}
```

Make a note of the keys that are used to store the long and short forms:

```

\glsshortkey
1347 \newcommand*{\glsshortkey}{text}

```

```

\glsshortpluralkey
1348 \newcommand*{\glsshortpluralkey}{plural}

```

```

\glslongkey
1349 \newcommand*{\glslongkey}{description}

```

```

\glslongpluralkey
1350 \newcommand*{\glslongpluralkey}{descriptionplural}

```

Using the default definitions, `\acrshort` is the same as `\glstext`, which means that it will print the abbreviation.

```

\acrshort
1351 \newcommand*{\acrshort}[2] []{%
1352 \new@ifnextchar[{\@acrshort{#1}{#2}}{\@acrshort{#1}{#2}[]}}%
1353 \def\@acrshort#1#2[#3]{\@glstext@{#1}{#2}{#3}}

```

```

\Acrshort
1354 \newcommand*{\Acrshort}[2] []{%
1355 \new@ifnextchar[{\@Acrshort{#1}{#2}}{\@Acrshort{#1}{#2}[]}}%
1356 \def\@Acrshort#1#2[#3]{\@Glstext@{#1}{#2}{#3}}

```

```

\ACRshort
1357 \newcommand*{\ACRshort}[2] []{%

```

5.15 Additional predefined acronym styles

\acronymfont This is only used with the additional acronym styles:

```
1405 \newcommand{\acronymfont}[1]{#1}
```

\firstacronymfont This is only used with the additional acronym styles:

```
1406 \newcommand{\firstacronymfont}[1]{\acronymfont{#1}}
```

```
1407 \ifglsacrdescription
```

If a description and footnote are both required, store the long form in the symbol key. Store the short form in text key.

```
1408 \ifglsacrfootnote
1409   \renewcommand{\newacronym}[4][]{%
1410     \newglossaryentry{#2}{type=\acronymtype,%
1411       name={\acronymfont{#3}},%
1412       sort={#3},%
1413       text={#3},%
1414       plural={#3\acrpluralsuffix},%
1415       symbol={#4},%
1416       symbolplural={#4\acrpluralsuffix},%
1417       #1}}

```

Set up the commands to make a note of the keys to store the long and short forms:

```
1418 \def\glsshortkey{text}%
1419 \def\glsshortpluralkey{plural}%
1420 \def\glslongkey{symbol}%
1421 \def\glslongpluralkey{symbolplural}%
```

Set up short cuts. Short form:

```

5.16 Predefined Glossary Styles

The glossaries bundle comes with some predefined glossary styles which are defined in the following packages:

```
1751 \RequirePackage{glossary-hypernav}  
1752 \RequirePackage{glossary-list}  
1753 \RequirePackage{glossary-long}  
1754 \RequirePackage{glossary-super}
```

The default glossary style is set according to the `style` package option, but can be overridden by `\glossarystyle`.

```
1755 \glossarystyle{@glossary@default@style}
```

6 Mfirstuc Documented Code

```
1756 \NeedsTeXFormat{LaTeX2e}  
1757 \ProvidesPackage{mfirstuc}[2008/06/18 v1.02 (NLCT)]
```

`\makefirstuc` Syntax:
`\makefirstuc{<text>}`
Makes the first letter uppercase, but will skip initial control sequences if they are followed by a group and make the first thing in the group uppercase, unless the group is empty. Thus `\makefirstuc{abc}` will produce: `Abc`, `\makefirstuc{\ae bc}` will produce: `Æbc`, but `\makefirstuc{\emph{abc}}` will produce `Abc`. This is required by `\Gls` and `\Glsp`.

```
1758 \newif\if@gls  
1759 \def\makefirstuc#1{  
1760 \def\gls@argi{#1}  
1761 \ifx\gls@argi\empty  
1762 \else  
1763 \protected@edef\gls@tmp{\ #1}  
1764 \onelevel@sanitize\gls@tmp
```

```

1765  \expandafter\@gls@checkcs\@gls@tmp\relax\relax
1766  \if@gls@scs
1767    \@gls@getbody #1{}\@nil
1768    \ifx\@gls@rest\@empty
1769      \@gls@makefirststuc{#1}%
1770    \else
1771      \expandafter\@gls@split\@gls@rest\@nil
1772      \ifx\@gls@first\@empty
1773        \@gls@makefirststuc{#1}%
1774      \else
1775        \@gls@body{\expandafter\@gls@makefirststuc\@gls@first}\@gls@rest%
1776      \fi
1777    \fi
1778  \else
1779    \@gls@makefirststuc{#1}%
1780  \fi
1781 \fi
1782 }

```

Put first argument in \@gls@first and second argument in \@gls@rest:

```

1783 \def\@gls@split#1#2\@nil{\def\@gls@first{#1}\def\@gls@rest{#2}}
1784 \def\@gls@checkcs#1 #2#3\relax{%
1785 \def\@gls@argi{#1}\def\@gls@argii{#2}%
1786 \ifx\@gls@argi\@gls@argii
1787   \@glscstrue
1788 \else
1789   \@glscsfalse
1790 \fi
1791 }

```

Make first thing upper case:

```
1792 \def\@gls@makefirststuc#1{\MakeUppercase #1}
```

Get the first grouped argument and stores in \@gls@body.

```
1793 \def\@gls@getbody#1{\def\@gls@body{#1}\@gls@gobbletonil}
```

Scoup up everything to \@nil and store in \@gls@rest:

```
1794 \def\@gls@gobbletonil#1\@nil{\def\@gls@rest{#1}}
```

\xmakefirststuc Expand argument once before applying \makefirststuc (added v1.01).

```

1795 \newcommand*{\xmakefirststuc}[1]{%
1796   \expandafter\makefirststuc\expandafter{#1}}

```

7 Glossary Styles

7.1 Glossary hyper-navigation definitions (glossary-hypernav package)

Package Definition:

```
1797 \ProvidesPackage{glossary-hypernav}[2007/07/04 v1.01 (NLCT)]
```

The commands defined in this package are provided to help navigate around the groups within a glossary (see [subsection 5.13.](#)) \printglossary (and

`\printglossaries`) set `\@glo@type` to the label of the current glossary. This is used to create a unique hypertarget in the event of multiple glossaries.

```
\glsnavhyperlink[<type>]{<label>}{<text>}
```

This command makes `<text>` a hyperlink to the glossary group whose label is given by `<label>` for the glossary given by `<type>`.

```
\glsnavhyperlink
```

```
1798 \@ifundefined{hyperlink}{%
1799 \newcommand*{\glsnavhyperlink}[3][]{\#3}}{%
1800 \newcommand*{\glsnavhyperlink}[3][\@glo@type]{%
1801 \edef\gls@grplabel{\#2}\protected@edef\gls@grptitle{\#3}%
1802 \hyperlink{glsn:#1@#2}{\#3}}}
```

```
\glsnavhypertarget[<type>]{<label>}{<text>}
```

This command makes `<text>` a hypertarget for the glossary group whose label is given by `<label>` in the glossary given by `<type>`.

```
\glsnavhypertarget
```

```
1803 \@ifundefined{hypertarget}{%
1804 \newcommand*{\glsnavhypertarget}[3][\@glo@type]{%
1805 \protected@write\@auxout{}{\string\gls@hypergroup{\#1}{\#2}}\%
1806 \#3}}{%
1807 \newcommand*{\glsnavhypertarget}[3][\@glo@type]{%
1808 \protected@write\@auxout{}{\string\gls@hypergroup{\#1}{\#2}}\%
1809 \hypertarget{glsn:#1@#2}{\#3}}}
```

`\@gls@hypergroup` This adds to (or creates) the command `\@gls@hypergrouplist@<glossary type>` which lists all groups for a given glossary, so that the navigation bar only contains those groups that are present. However it requires at least 2 runs to ensure the information is up-to-date.

```
1810 \newcommand*{\@gls@hypergroup}[2]{%
1811 \@ifundefined{@gls@hypergrouplist@#1}{%
1812 \expandafter\xdef\csname@gls@hypergrouplist@#1\endcsname{\#2}}{%
1813 }{%
1814 \expandafter\let\expandafter\@gls@tmp
1815 \csname@gls@hypergrouplist@#1\endcsname
1816 \expandafter\xdef\csname@gls@hypergrouplist@#1\endcsname{%
1817 \@gls@tmp,\#2}}%
1818 }%
1819 }
```

The `\glsnavigation` command displays a simple glossary group navigation. The symbol and number elements are defined separately, so that they can be suppressed if need be. Note that this command will produce a link to all 28 groups, but some groups may not be defined if there are groups that do not contain any terms, in which case you will get an undefined hyperlink warning. Now for the whole navigation bit:

```
\glsnavigation
```

```
1820 \newcommand*{\glsnavigation}{%
```

```

1821 \def\@gls@between{}%
1822 \@ifundefined{@gls@hypergrouplist@\glo@type}{%
1823     \def\@gls@list{}%
1824 }%
1825     \expandafter\let\expandafter\@gls@list
1826         \csname @gls@hypergrouplist@\glo@type\endcsname
1827 }%
1828 \foreach\@gls@tmp:=\@gls@list\do{%
1829     \gls@between
1830     \glsnavhyperlink{\@gls@tmp}{\glsgetgrouptitle{\@gls@tmp}}%
1831     \let\@gls@between\glshypernavsep%
1832 }%
1833 }

```

\glshypernavsep Separator for the hyper navigation bar.

```
1834 \newcommand*{\glshypernavsep}{\space\textbar\space}
```

The \glssymbolnav produces a simple navigation set of links for just the symbol and number groups. This used to be used at the start of \glsnavigation. This command is no longer needed.

\glssymbolnav

```

1835 \newcommand*{\glssymbolnav}{%
1836 \glsnavhyperlink{glssymbols}{\glsgetgrouptitle{glssymbols}} \textbar\
1837 \glsnavhyperlink{glsnumbers}{\glsgetgrouptitle{glsnumbers}} \textbar\
1838 }

```

7.2 List Style (glossary-list package)

The glossary-list package defines glossary styles that use the description environment. Note that since the entry name is placed in the optional argument to the \item command, it will appear in a bold font by default.

```
1839 \ProvidesPackage{glossary-list}[2008/02/16 v1.03 (NLCT)]
```

The list glossary style uses the description environment. The group separator \glsgroupskip is redefined as \indexspace which produces a gap between groups. The glossary heading and the group headings do nothing. This is used as the default style for the glossaries package.

```

1840 \newglossarystyle{list}{%
1841 \renewenvironment{theglossary}{\begin{description}}{\end{description}}%
1842 \renewcommand*{\glossaryheader}{}%
1843 \renewcommand*{\glsgroupheading}[1]{}%
1844 \renewcommand*{\glossaryentryfield}[5]{%
1845 \item[\@glostarget{\glo:#1}{##2}] ##3\glspostdescription\space ##5}%
1846 \renewcommand*{\glsgroupskip}{\indexspace}}

```

The listgroup style is like the list style, but the glossary groups have headings.

```

1847 \newglossarystyle{listgroup}{%
1848 \glossarystyle{list}}%
1849 \renewcommand*{\glsgroupheading}[1]{\item[\glsgetgrouptitle{##1}]}

```

The listhypergroup style is like the listgroup style, but has a set of links to the groups at the start of the glossary.

```
1850 \newglossarystyle{listhypergroup}{%
```

```

1851 \glossarystyle{list}%
1852 \renewcommand*\glossaryheader{%
1853 \item[\glsnavigation]}%
1854 \renewcommand*\glsgroupheading}[1]{%
1855 \item[\glsnahypertarget{\#\#1}{\glsgrouptitle{\#\#1}}]}}

```

The `altlist` glossary style is like the `list` style, but places the description on a new line.

```

1856 \newglossarystyle{altlist}{%
1857 \glossarystyle{list}%
1858 \renewcommand*\glossaryentryfield}[5]{%
1859 \item[\@glstarget{glo:\#\#1}{\#\#2}]\mbox{}\newline ##3\glspostdescription\space ##5}%
1860 }

```

The `altlistgroup` glossary style is like the `altlist` style, but the glossary groups have headings.

```

1861 \newglossarystyle{altlistgroup}{%
1862 \glossarystyle{altlist}%
1863 \renewcommand*\glsgroupheading}[1]{\item[\glsgrouptitle{\#\#1}]}}

```

The `altlisthypergroup` glossary style is like the `altlisthypergroup` style, but has a set of links to the groups at the start of the glossary.

```

1864 \newglossarystyle{altlisthypergroup}{%
1865 \glossarystyle{altlist}%
1866 \renewcommand*\glossaryheader{%
1867 \item[\glsnavigation]}%
1868 \renewcommand*\glsgroupheading}[1]{%
1869 \item[\glsnahypertarget{\#\#1}{\glsgrouptitle{\#\#1}}]}}

```

The `listdotted` glossary style was supplied by Axel Menzel. I've modified it slightly so that the distance from the start of the name to the end of the dotted line is specified by `\glslistdottedwidth`.

```

\glslistdottedwidth
1870 \newlength\glslistdottedwidth
1871 \setlength{\glslistdottedwidth}{.5\linewidth}

```

Note that this style ignores the page numbers as well as the symbol.

```

1872 \newglossarystyle{listdotted}{%
1873 \glossarystyle{list}%
1874 \renewcommand*\glossaryentryfield}[5]{%
1875 \item[]\makebox[\glslistdottedwidth][l]{\@glstarget{glo:\#\#1}{\#\#2}}%
1876 \unskip\leaders\hbox to 2.9mm{\hss}\hfill\strut}##3}

```

7.3 Glossary Styles using longtable (the glossary-long package)

The glossary styles defined in the `glossary-long` package used the `longtable` environment in the glossary.

```
1877 \ProvidesPackage{glossary-long}[2007/07/04 v1.01 (NLCT)]
```

Requires the `longtable` package:

```
1878 \RequirePackage{longtable}
```

This is a length that governs the width of the description column.

```
\glsdescwidth
```

```
1879 \newlength\glsdescwidth
```

This is a length that governs the width of the page list column.

```
\glspagelistwidth
```

```
1880 \newlength\glspagelistwidth
```

Default values:

```
1881 \setlength{\glsdescwidth}{0.6\linewidth}
```

```
1882 \setlength{\glspagelistwidth}{0.1\linewidth}
```

The long glossary style command which uses the `longtable` environment:

```
1883 \newglossarystyle{long}{%
```

```
1884 \renewenvironment{theglossary}{\begin{longtable}{lp{\glsdescwidth}}}{%
```

```
1885 \end{longtable}}%
```

```
1886 \renewcommand*\glossaryheader{}%
```

```
1887 \renewcommand*\glsgroupheading[1]{}%
```

```
1888 \renewcommand*\glossaryentryfield[5]{}%
```

```
1889 \glstarget{glo:#1}{##2} & #3\glspostdescription\space ##5\\}%
```

```
1890 \renewcommand*\glsgroupskip{} & \\}}
```

The `longborder` style is like the above, but with horizontal and vertical lines:

```
1891 \newglossarystyle{longborder}{%
```

```
1892 \glossarystyle{long}{%
```

```
1893 \renewenvironment{theglossary}{%
```

```
1894 \begin{longtable}{|l|p{\glsdescwidth}|}{\end{longtable}}%
```

```
1895 \renewcommand*\glossaryheader{\hline\endhead\hline\endfoot}{%
```

```
1896 }
```

The `longheader` style is like the `long` style but with a header:

```
1897 \newglossarystyle{longheader}{%
```

```
1898 \glossarystyle{long}{%
```

```
1899 \renewcommand*\glossaryheader{}%
```

```
1900 \bfseries \entryname & \bfseries \descriptionname\\
```

```
1901 \endhead{}}
```

The `longheaderborder` style is like the `long` style but with a header and border:

```
1902 \newglossarystyle{longheaderborder}{%
```

```
1903 \glossarystyle{longborder}{%
```

```
1904 \renewcommand*\glossaryheader{}%
```

```
1905 \hline\bfseries \entryname & \bfseries \descriptionname\\hline
```

```
1906 \endhead{}
```

```
1907 \hline\endfoot{}}
```

The `long3col` style is like `long` but with 3 columns

```
1908 \newglossarystyle{long3col}{%
```

```
1909 \renewenvironment{theglossary}{\begin{longtable}{lp{\glsdescwidth}p{\glspagelistwidth}}}{%
```

```
1910 \end{longtable}}%
```

```
1911 \renewcommand*\glossaryheader{}%
```

```
1912 \renewcommand*\glsgroupheading[1]{}%
```

```
1913 \renewcommand*\glossaryentryfield[5]{}%
```

```
1914 \glstarget{glo:#1}{##2} & #3 & ##5\\}%
```

```
1915 \renewcommand*\glsgroupskip{} & & \\}}
```

The `long3colborder` style is like the `long3col` style but with a border:

```
1916 \newglossarystyle{long3colborder}{%
1917   \glossarystyle{long3col}%
1918   \renewenvironment{theglossary}{%
1919     \begin{longtable}{|l|p{\glscdescwidth}|p{\glspagelistwidth}|}}{%
1920   \end{longtable}}%
1921   \renewcommand*\glossaryheader{\hline\endhead\hline\endfoot}%
1922 }
```

The `long3colheader` style is like `long3col` but with a header row:

```
1923 \newglossarystyle{long3colheader}{%
1924   \glossarystyle{long3col}%
1925   \renewcommand*\glossaryheader{%
1926     \bfseries\entryname&\bfseries\descriptionname&
1927     \bfseries\pagelistname\\endhead}%
1928 }
```

The `long3colheaderborder` style is like the above but with a border

```
1929 \newglossarystyle{long3colheaderborder}{%
1930   \glossarystyle{long3colborder}%
1931   \renewcommand*\glossaryheader{%
1932     \hline
1933     \bfseries\entryname&\bfseries\descriptionname&
1934     \bfseries\pagelistname\\hline\endhead
1935     \hline\endfoot}%
1936 }
```

The `long4col` style has four columns where the third column contains the value of the associated `symbol` key.

```
1937 \newglossarystyle{long4col}{%
1938   \renewenvironment{theglossary}{%
1939     \begin{longtable}{llll}}{%
1940   \end{longtable}}%
1941   \renewcommand*\glossaryheader{}%
1942   \renewcommand*\glsgrouphading[1]{}%
1943   \renewcommand*\glossaryentryfield[5]{}%
1944   \glostarget{glo:#1}{##2} & ##3 & ##4 & ##5\\}%
1945   \renewcommand*\glsgroupskip{ & & &\\}}
```

The `long4colheader` style is like `long4col` but with a header row.

```
1946 \newglossarystyle{long4colheader}{%
1947   \glossarystyle{long4col}%
1948   \renewcommand*\glossaryheader{%
1949     \bfseries\entryname&\bfseries\descriptionname&
1950     \bfseries\symbolname&
1951     \bfseries\pagelistname\\endhead}%
1952 }
```

The `long4colborder` style is like `long4col` but with a border.

```
1953 \newglossarystyle{long4colborder}{%
1954   \glossarystyle{long4col}%
1955   \renewenvironment{theglossary}{%
1956     \begin{longtable}{|l|l|l|l|}}{%
1957   \end{longtable}}%
1958   \renewcommand*\glossaryheader{\hline\endhead\hline\endfoot}%
1959 }
```

The `long4colheaderborder` style is like the above but with a border.

```
1960 \newglossarystyle{long4colheaderborder}{%
1961   \glossarystyle{long4col}%
1962   \renewenvironment{theglossary}{%
1963     \begin{longtable}{|l|l|l|l|}}{%
1964   \end{longtable}}%
1965   \renewcommand*\glossaryheader{%
1966     \hline\bfseries\entryname&\bfseries\descriptionname&
1967     \bfseries \symbolname&
1968     \bfseries\pagelistname\\hline\endhead\hline\endfoot}%
1969 }
```

7.4 Glossary Styles using supertabular environment (glossary-super package)

The glossary styles defined in the `glossary-super` package use the `supertabular` environment.

```
1970 \ProvidesPackage{glossary-super}[2007/07/04 v1.01 (NLCT)]
```

Requires the `supertabular` package:

```
1971 \RequirePackage{supertabular}
```

The `super` glossary style uses the `supertabular` environment (it uses lengths defined in the `glossary-long` package.)

```
1972 \newglossarystyle{super}{%
1973   \renewenvironment{theglossary}{%
1974     \tablehead{}\tabletail{}%
1975     \begin{supertabular}{lp{\glscwidth}}}}{%
1976   \end{supertabular}}%
1977   \renewcommand*\glossaryheader{%
1978     \renewcommand*\glsgroupheading[1]{%
1979       \renewcommand*\glossaryentryfield[5]{%
1980         @glstarget{glo:\#1}{\#2} & \glspostdescription\space ##5\\}%
1981       \renewcommand*\glsgroupskip{ & \\}}%
1982 }
```

The `superborder` style is like the above, but with horizontal and vertical lines:

```
1982 \newglossarystyle{superborder}{%
1983   \glossarystyle{super}%
1984   \renewenvironment{theglossary}{%
1985     \tablehead{\hline}\tabletail{\hline}%
1986     \begin{supertabular}{|l|p{\glscwidth}|}}{\end{supertabular}}%
1987 }
```

The `superheader` style is like the `super` style, but with a header:

```
1988 \newglossarystyle{superheader}{%
1989   \glossarystyle{super}%
1990   \renewenvironment{theglossary}{%
1991     \tablehead{\bfseries \entryname & \bfseries \descriptionname\\}%
1992     \tabletail{}%
1993     \begin{supertabular}{lp{\glscwidth}}}}{\end{supertabular}}%
1994 }
```

The `superheaderborder` style is like the `super` style but with a header and border:

```
1995 \newglossarystyle{superheaderborder}{%
1996   \glossarystyle{super}%
```

```

1997 \renewenvironment{theglossary}{%
1998 \tablehead{\hline\bfseries \entryname & \bfseries \descriptionname\\\hline}%
1999 \tabletail{\hline}%
2000 \begin{supertabular}{|l|p{\glsdescwidth}|}{}{\end{supertabular}}% 
2001 }

```

The `super3col` style is like the `super` style, but with 3 columns:

```

2002 \newglossarystyle{super3col}{%
2003 \renewenvironment{theglossary}{%
2004 \tablehead{} \tabletail{}%
2005 \begin{supertabular}{lp{\glsdescwidth}p{\glspagelistwidth}}{}{\end{supertabular}}% 
2006 \end{supertabular}}% 
2007 \renewcommand*\glossaryheader{}%
2008 \renewcommand*\glsgroupheading}[1]{}%
2009 \renewcommand*\glossaryentryfield}[5]{}%
2010 \glsstart{glo:#1}{##2} & #3 & ##5\\}%
2011 \renewcommand*\glsgroupskip}{ & &\}%

```

The `super3colborder` style is like the `super3col` style, but with a border:

```

2012 \newglossarystyle{super3colborder}{%
2013 \glossarystyle{super3col}%
2014 \renewenvironment{theglossary}{%
2015 \tablehead{\hline}\tabletail{\hline}%
2016 \begin{supertabular}{|l|p{\glsdescwidth}|p{\glspagelistwidth}|}{}{\end{supertabular}}% 
2017 \end{supertabular}}% 
2018 }

```

The `super3colheader` style is like the `super3col` style but with a header row:

```

2019 \newglossarystyle{super3colheader}{%
2020 \glossarystyle{super3col}%
2021 \renewenvironment{theglossary}{%
2022 \tablehead{\bfseries \entryname\&\bfseries \descriptionname\&%
2023 \bfseries \pagelistname\\}\tabletail{}%
2024 \begin{supertabular}{lp{\glsdescwidth}p{\glspagelistwidth}}{}{\end{supertabular}}% 
2025 \end{supertabular}}% 
2026 }

```

The `super3colheaderborder` style is like the `super3col` style but with a header and border:

```

2027 \newglossarystyle{super3colheaderborder}{%
2028 \glossarystyle{super3colborder}%
2029 \renewenvironment{theglossary}{%
2030 \tablehead{\hline%
2031 \bfseries \entryname\&\bfseries \descriptionname\&%
2032 \bfseries \pagelistname\\hline}%
2033 \tabletail{\hline}%
2034 \begin{supertabular}{|l|p{\glsdescwidth}|p{\glspagelistwidth}|}{}{\end{supertabular}}% 
2035 \end{supertabular}}% 
2036 }

```

The `super4col` glossary style has four columns, where the third column contains the value of the corresponding symbol key used when that entry was defined.

```

2037 \newglossarystyle{super4col}{%
2038 \renewenvironment{theglossary}{%
2039 \tablehead{} \tabletail{}%
2040 \begin{supertabular}{llll}{}%

```

```

2041 \end{supertabular}}%
2042 \renewcommand*\glossaryheader{}%
2043 \renewcommand*\glsgrouphereading}[1]{}
2044 \renewcommand*\glossaryentryfield}[5]{%
2045 \gls@target{glo:#1}{##2} & ##3 & ##4 & ##5\\}%
2046 \renewcommand*\glsgroupskip}{ & & & }%

```

The `super4colheader` style is like the `super4col` but with a header row.

```

2047 \newglossarystyle{super4colheader}{%
2048 \glossarystyle{super4col}%
2049 \renewenvironment{theglossary}{%
2050 \tablehead{\bfseries\entryname\&\bfseries\descriptionname&
2051 \bfseries\symbolname &
2052 \bfseries\pagelistname\}\tabletail{}}%
2053 \begin{supertabular}{lllll}}{%
2054 \end{supertabular}}%
2055 }

```

The `super4colborder` style is like the `super4col` but with a border.

```

2056 \newglossarystyle{super4colborder}{%
2057 \glossarystyle{super4col}%
2058 \renewenvironment{theglossary}{%
2059 \tablehead{\hline\tabletail{\hline}}%
2060 \begin{supertabular}{|l|l|l|l|}}{%
2061 \end{supertabular}}%
2062 }

```

The `super4colheaderborder` style is like the `super4col` but with a header and border.

```

2063 \newglossarystyle{super4colheaderborder}{%
2064 \glossarystyle{super4col}%
2065 \renewenvironment{theglossary}{%
2066 \tablehead{\hline\bfseries\entryname\&\bfseries\descriptionname&
2067 \bfseries\symbolname &
2068 \bfseries\pagelistname\}\tabletail{\hline}}%
2069 \begin{supertabular}{|l|l|l|l|}}{%
2070 \end{supertabular}}%
2071 }

```

8 Multi-Lingual Support

Many thanks to everyone who contributed to the translations both via email and on `comp.text.tex`.

8.1 Babel Captions

Define `babel` captions if multi-lingual support is required, but the `translator` package is not loaded.

```

2072 \NeedsTeXFormat{LaTeX2e}
2073 \ProvidesPackage{glossaries-babel}[2008/02/22 v1.0 (NLCT)]

```

English:

```

2074 \addto\captionsenglish{%
2075 \renewcommand*\glossaryname{Glossary}%
2076 \renewcommand*\acronymname{Acronyms}%

```

```

2077 \renewcommand*\{\entryname\}{Notation}%
2078 \renewcommand*\{\descriptionname\}{Description}%
2079 \renewcommand*\{\symbolname\}{Symbol}%
2080 \renewcommand*\{\pagelistname\}{Page List}%
2081 \renewcommand*\{\glssymbolsgroupname\}{Symbols}%
2082 \renewcommand*\{\glsnumbersgroupname\}{Numbers}%
2083 }%

```

German (quite a few variations were suggested for German; I settled on the following):

```

2084 \addto\captionsgerman{%
2085 \renewcommand*\{\glossaryname\}{Glossar}%
2086 \renewcommand*\{\acronymname\}{Akronyme}%
2087 \renewcommand*\{\entryname\}{Bezeichnung}%
2088 \renewcommand*\{\descriptionname\}{Beschreibung}%
2089 \renewcommand*\{\symbolname\}{Symbol}%
2090 \renewcommand*\{\pagelistname\}{Seiten}%
2091 \renewcommand*\{\glssymbolsgroupname\}{Symbole}%
2092 \renewcommand*\{\glsnumbersgroupname\}{Zahlen}%

```

ngerman is identical to German:

```

2093 \addto\captionsngerman{%
2094 \renewcommand*\{\glossaryname\}{Glossar}%
2095 \renewcommand*\{\acronymname\}{Akronyme}%
2096 \renewcommand*\{\entryname\}{Bezeichnung}%
2097 \renewcommand*\{\descriptionname\}{Beschreibung}%
2098 \renewcommand*\{\symbolname\}{Symbol}%
2099 \renewcommand*\{\pagelistname\}{Seiten}%
2100 \renewcommand*\{\glssymbolsgroupname\}{Symbole}%
2101 \renewcommand*\{\glsnumbersgroupname\}{Zahlen}%

```

Italian:

```

2102 \addto\captionsitalian{%
2103 \renewcommand*\{\glossaryname\}{Glossario}%
2104 \renewcommand*\{\acronymname\}{Acronimi}%
2105 \renewcommand*\{\entryname\}{Nomenclatura}%

8.2 Danish Dictionary

This is a dictionary file provided for use with the `translator` package.

```
2175 \ProvidesDictionary{glossaries-dictionary}{Danish}
```

Provide Danish translations:

```
2176 \providetranslation{Glossary}{Ordliste}
2177 \providetranslation{Acronyms}{Akronymer}
2178 \providetranslation{Notation (glossaries)}{Symbolforklaring}
2179 \providetranslation{Description (glossaries)}{Beskrivelse}
2180 \providetranslation{Symbol (glossaries)}{Symbol}
2181 \providetranslation{Page List (glossaries)}{Side}
2182 \providetranslation{Symbols (glossaries)}{Symboler}
2183 \providetranslation{Numbers (glossaries)}{Tal}
```

8.3 Dutch Dictionary

This is a dictionary file provided for use with the `translator` package.

```
2184 \ProvidesDictionary{glossaries-dictionary}{Dutch}
```

Provide Dutch translations:

```
2185 \providetranslation{Glossary}{Woordenlijst}
2186 \providetranslation{Acronyms}{Acroniemen}
2187 \providetranslation{Notation (glossaries)}{Benaming}
2188 \providetranslation{Description (glossaries)}{Beschrijving}
2189 \providetranslation{Symbol (glossaries)}{Symbool}
2190 \providetranslation{Page List (glossaries)}{Pagina's}
2191 \providetranslation{Symbols (glossaries)}{Symbolen}
2192 \providetranslation{Numbers (glossaries)}{Cijfers}
```

8.4 English Dictionary

This is a dictionary file provided for use with the `translator` package.

```
2193 \ProvidesDictionary{glossaries-dictionary}{English}
```

Provide English translations:

```
2194 \providetranslation{Glossary}{Glossary}
2195 \providetranslation{Acronyms}{Acronyms}
2196 \providetranslation{Notation (glossaries)}{Notation}
2197 \providetranslation{Description (glossaries)}{Description}
```

```
2198 \providetranslation{Symbol (glossaries)}{Symbol}
2199 \providetranslation{Page List (glossaries)}{Page List}
2200 \providetranslation{Symbols (glossaries)}{Symbols}
2201 \providetranslation{Numbers (glossaries)}{Numbers}
```

8.5 French Dictionary

This is a dictionary file provided for use with the translator package.

```
2202 \ProvidesDictionary{glossaries-dictionary}{French}
```

Provide French translations:

```
2203 \providetranslation{Glossary}{Glossaire}
2204 \providetranslation{Acronyms}{Acronymes}
2205 \providetranslation{Notation (glossaries)}{Terme}
2206 \providetranslation{Description (glossaries)}{Description}
2207 \providetranslation{Symbol (glossaries)}{Symbole}
2208 \providetranslation{Page List (glossaries)}{Pages}
2209 \providetranslation{Symbols (glossaries)}{Symboles}
2210 \providetranslation{Numbers (glossaries)}{Nombres}
```

8.6 German Dictionary

This is a dictionary file provided for use with the translator package.

```
2211 \ProvidesDictionary{glossaries-dictionary}{German}
```

Provide German translations (quite a few variations were suggested for German; I settled on the following):

```
2212 \providetranslation{Glossary}{Glossar}
2213 \providetranslation{Acronyms}{Akronyme}
2214 \providetranslation{Notation (glossaries)}{Bezeichnung}
2215 \providetranslation{Description (glossaries)}{Beschreibung}
2216 \providetranslation{Symbol (glossaries)}{Symbol}
2217 \providetranslation{Page List (glossaries)}{Seiten}
2218 \providetranslation{Symbols (glossaries)}{Symbole}
2219 \providetranslation{Numbers (glossaries)}{Zahlen}
```

8.7 Irish Dictionary

This is a dictionary file provided for use with the translator package.

```
2220 \ProvidesDictionary{glossaries-dictionary}{Irish}
```

Provide Irish translations:

```
2221 \providetranslation{Glossary}{Gluais}
2222 \providetranslation{Acronyms}{Acrainmneacha}
2223 \providetranslation{Notation (glossaries)}{Ciall}
2224 \providetranslation{Description (glossaries)}{Tuairisc}
2225 \providetranslation{Symbol (glossaries)}{Comhartha}
2226 \providetranslation{Page List (glossaries)}{Leathanáigh}
2227 \providetranslation{Symbols (glossaries)}{Comhartha'\{\i\}}
2228 \providetranslation{Numbers (glossaries)}{Uimhreacha}
```

8.8 Italian Dictionary

This is a dictionary file provided for use with the `translator` package.

2229 \ProvidesDictionary{glossaries-dictionary}{Italian}

Provide Italian translations:

```
2230 \providetranslation{Glossary}{Glossario}
2231 \providetranslation{Acronyms}{Acronimi}
2232 \providetranslation{Notation (glossaries)}{Nomenclatura}
2233 \providetranslation{Description (glossaries)}{Descrizione}
2234 \providetranslation{Symbol (glossaries)}{Simbolo}
2235 \providetranslation{Page List (glossaries)}{Elenco delle pagine}
2236 \providetranslation{Symbols (glossaries)}{Simboli}
2237 \providetranslation{Numbers (glossaries)}{Numeri}
```

8.9 Magyar Dictionary

This is a dictionary file provided for use with the `translator` package.

2238 \ProvidesDictionary{glossaries-dictionary}{Magyar}

Provide translations:

```
2239 \providetranslation{Glossary}{Sz\'ojegyz\'ek}
2240 \providetranslation{Acronyms}{Bet\H uszavak}
2241 \providetranslation{Notation (glossaries)}{Kifejez\'es}
2242 \providetranslation{Description (glossaries)}{Magyar\'azat}
2243 \providetranslation{Symbol (glossaries)}{Jel\"ol\'es}
2244 \providetranslation{Page List (glossaries)}{Oldalsz\'am}
2245 \providetranslation{Symbols (glossaries)}{Jelek}
2246 \providetranslation{Numbers (glossaries)}{Sz\'amjegyek}
```

8.10 Polish Dictionary

This is a dictionary file provided for use with the `translator` package.

2247 \ProvidesDictionary{glossaries-dictionary}{Polish}

Provide Polish translations:

```
2248 \providetranslation{Glossary}{S\lownik termin\ow}
2249 \providetranslation{Acronyms}{Skr\ot}
2250 \providetranslation{Notation (glossaries)}{Termin}
2251 \providetranslation{Description (glossaries)}{Opis}
2252 \providetranslation{Symbol (glossaries)}{Symbol}
2253 \providetranslation{Page List (glossaries)}{Strony}
2254 \providetranslation{Symbols (glossaries)}{Symbole}
2255 \providetranslation{Numbers (glossaries)}{Liczby}
```

8.11 Spanish Dictionary

This is a dictionary file provided for use with the `translator` package.

2256 \ProvidesDictionary{glossaries-dictionary}{Spanish}

Provide Spanish translations:

```
2257 \providetranslation{Glossary}{Glosario}
2258 \providetranslation{Acronyms}{Siglas}
2259 \providetranslation{Notation (glossaries)}{Entrada}
```

```
2260 \providetranslation{Description (glossaries)}{Descripci\'on}
2261 \providetranslation{Symbol (glossaries)}{S\'{\i}mbolo}
2262 \providetranslation{Page List (glossaries)}{Lista de p\'aginas}
2263 \providetranslation{Symbols (glossaries)}{S\'{\i}mbolos}
2264 \providetranslation{Numbers (glossaries)}{N\'umeros}
```
