

The `includex` LaTeX package

extra ways to include files

Matt Swift <`swift@alum.mit.edu`>

Version: 0.6a Date: 1999/02/23
Documentation revision: 1999/02/23

Abstract

Includex allows you to include just the contents of one source file into another, ignoring the text outside the `\begin{document}` . . . `\end{document}` in the included file.

This package is useful but may have problems and is unsupported.
See also the *newclude* package.

Part I

Discussion

1 Including Files

`\include*` `\include` was always pretty useless to me because it did a `\clearpage` before and after the `\input`. The macro `\include*` is defined below to be like `\include` but without the `\clearpage`s.

The other thing we do is define a command `\includedoc`, which includes a file which is allowed to have its own `\documentclass` and `\begin{document}` and `\end{document}` and `\usepackage` commands.

This opens up a whole new world of truly modular L^AT_EX files. There is even nothing special about extracting the `document` environment, we can extract *any* environment, or perhaps even other things.

There are some problems, however. Maybe the `\usepackage` is necessary, maybe it would conflict. Same with other commands like the `\newcommand` family. It is simply not (yet) an issue in L^AT_EX design to consider the implications of parent files. The problems are not insurmountable. We can begin by working with a convention, and ultimately maybe make some changes in certain macros. I will be getting to all this. I admit I have not looked carefully to see whether the design specifications of L^AT_EX3 address these important issues.

The macros here will be useful in many circumstances, when the included files are themselves simple.

There are now two main commands, `\includedoc` and `\includedocskip`, each with a * version analogous to the new `\include*`. Each take a filename as an argument just like `\include`.

`\includedoc {<filename>}` reads everything in the file except for `\documentclass`, `\usepackage`, `\begin{document}`, `\end{document}` (and whatever follows it).

`\includedocskip {<filename>}` does the same except it also skips everything between `\documentclass` and `\begin{document}`.

At present there is a makeshift way to ignore additional commands when using `\includedoc` and `\includedocskip`. If you want to cause `\foo` which takes no arguments to be disabled, say `\disable{\let\foo\relax}`. If `\foo` takes one mandatory argument, say `\let\foo\Gobble` instead. If `\foo` takes one optional and one mandatory, say `\let\foo\GobbleOM`. If `\foo` takes two mandatory arguments, say `\let\foo\GobbleMM`. For other permutations of arguments, you can extrapolate from the macros defined below.

Part II

Implementation

2 Version control

```
\fileinfo These definitions must be the first ones in the file.  
\DoXUsepackageE  
\HaveECitationS  
\fileversion  
\filedate  
\docdate  
\PPOptArg  
1 \def\fileinfo{extra ways to include files}  
2 \def\DoXPackageS {}  
3 \def\fileversion{v0.6a}  
4 \def\filedate{1999/02/23}  
5 \def\docdate{1999/02/23}  
6 \edef\PPOptArg {\%  
7   \filedate\space \fileversion\space \fileinfo  
8 }
```

If we're loading this file from a `\ProcessDTXFile` command (see the `compsci` package), then `\JusTLoaDInformatioN` will be defined; otherwise we assume it is not (that's why the FunkY Name).

If we're loading from `\ProcessDTXFile`, we want to load the packages listed in `\DoXPackageS` (needed to typeset the documentation for this file) and then bail out. Otherwise, we're using this file in a normal way as a package, so do nothing. `\DoXPackageS`, if there are any, are declared in the `dtx` file, and, if you're reading the typeset documentation of this package, would appear just above. (It's OK to call `\usepackage` with an empty argument or `\relax`, by the way.)

```
9 \makeatletter% A special comment to help create bst files. Don't change!  
10 \@ifundefined{JusTLoaDInformatioN} {\%  
11 }{\% ELSE (we know the compsci package is already loaded, too)  
12   \UndefineCS\JusTLoaDInformatioN  
13   \SaveDoXVarS  
14   \eExpand\csname DoXPackageS\endcsname\In {\%use \csname in case it's undefined  
15     \usepackage{\#1}\%  
16   }\%  
17   \RestoreDoXVarS  
18   \makeatother  
19   \endinput  
20 }% A special comment to help create bst files. Don't change!
```

Now we check for L^AT_EX2e and declare the LaTeX package.

```
21 \NeedsTeXFormat{LaTeX2e}  
22 \ProvidesPackage{includex}[\PPOptArg]
```

3 Requirements

Now we declare the package, check for L^AT_EX2e, and load the other packages needed.

```
23 \NeedsTeXFormat{LaTeX2e}
```

```

24 \ProvidesPackage{includex}
25 \RequirePackage{moredefs}
```

4 Disabling things

\disable This allows the disabling hacks.

```

26 \ReserveCS\DisableMonster % This line is elsewhere for main package
27 \newcommand\disable[1] {%
28   \g@addto@macro\DisableMonster{#1}%
29 }
```

5 New things

```

\sc@saved@include This is a simple redefinition of \include without the \clearpage commands.
\include Nothing tricky going on.
\sc@include 30 \newlet\sc@saved@include\include
\sc@@include 31 \renewcommand\include {%
32   \@ifstar
33     \sc@include
34     \sc@saved@include
35 }
36 \newcommand\sc@include {%
37   \relax
38   \ifnum\@auxout=\@partaux
39     \@latex@error{\string\include\space cannot be nested}\@eha
40   \else
41     \expandafter\sc@@include
42   \fi
43 }
44 \newcommand\sc@@include[1] {%
45   \if@files
46     \immediate\write\@mainaux{\string\@input{#1.aux}}%
47   \fi
48   \tempswatru
49   \if@partsw
50     \tempswafalse
51     \edef\tempb{#1}%
52     \for \tempa:=\partlist
53       \do{\ifx\tempa
54         \tempb
55         \tempswatru
56       \fi}%
57   \fi
58   \if@tempswa
59     \let\@auxout\@partaux
60     \if@files
61       \immediate\openout\@partaux #1.aux%
```

```

62      \immediate\write\@partaux{\relax}%
63      \fi
64      \@input{#1.tex}%
65      \@writeckpt{#1}%
66      \if@filesw
67 % NOTE: Robin took out the \immediate here.
68 %       \immediate\closeout\@partaux
69      \closeout\@partaux
70      \fi
71  \else
72      \nameuse{cp@#1}%
73  \fi
74  \let\auxout\mainaux
75 }

```

Now we start dealing with the much more tricky extraction of the document environment.

We start with considering how to quit inputting a file. The idea is to make the `\end{document}` command of the included file call `\endinput`. But there is a hitch that characters on the line after the `\end{document}` get inserted when you don't want them to. To beat that limitation, we have to do some work.

`\sc@radical@shutdown` We will add a bunch of commands to this macro, with the idea of `\catcode` ing everything and its brother to a comment. This would be a brute force method!

```
76 \ReserveCS\sc@radical@shutdown
```

First log a message that we're about to do some crazy things. In case something ever goes wrong, this might help.

```

77 \addto@macro\sc@radical@shutdown {%
78   \PackageInfo{includex}{\protect\sc@radical@shutdown\space beginning}%
79 }
```

Now we start adding `\catcode` commands. These first two should be redundant; but just in case someone changed things. . . .

```

80 \addto@macro\sc@radical@shutdown{\catcode`\\=14}    % 14 = comment
81 \addto@macro\sc@radical@shutdown{\catcode`^=7}       % 7 = superscript
```

`\sc@disable@char` Next, we define a command we will use in a loop in a moment.

```

82 \newcommand\sc@disable@char[1] {%
83   \addto@macro\sc@radical@shutdown
84     {\catcode`#1=14}} % 14 = comment
```

The following list contains every keyboard char except these three, which are treated specially: `%#`. The first is already a comment, and we handle the second in a moment. Each character in the following list is `\catcode`d to a comment:

```

85 \tfor\sc@t@a:=abcdefghijklmnopqrstuvwxyz%
86               ABCDEFGHIJKLMNOPQRSTUVWXYZ%
87               ^!@#$*&()_+-=[ ]|/?.,<>%
88               1234567890%
```

```

89           ' , " ; : %
90           \^\\"{\}\ % this is really the chars "\{\}" and space
91 \do {\expandafter\sc@disable@char\sc@t@a}

We add # separately, because it's tricky or impossible to put it into the list we
just used.

92 \sc@disable@char\#

We end the macro with \endinput. This has to come after all the previous,
otherwise, TeX goes ahead and reads to the end of the line immediately, with
regular catcodes. This is a good theory, I'm not sure it's necessary.

93 \addto@macro\sc@radical@shutdown{\endinput}

\sc@radical@shutdown@aftergroup
We need to use \sc@radical@shutdown this way.

94 \newcommand\sc@radical@shutdown@aftergroup {%
95   \aftergroup\sc@radical@shutdown
96 }

\sc@begindoc@toks These are for \AtBeginIncludedDocument and \AtEndIncludedDocument.
\sc@enddoc@toks
97 \newtoks\sc@begindoc@toks
98 \sc@begindoc@toks{}
99 \newtoks\sc@enddoc@toks
100 \sc@enddoc@toks{}

\AtBeginIncludedDocument The analogue of \AtBeginDocument.

101 \newcommand\AtBeginIncludedDocument[1] {%
102   \sc@begindoc@toks\expandafter{\the\sc@begindoc@toks#1}%
103 }

\AtEndIncludedDocument The analogue of \AtEndDocument

104 \newcommand\AtEndIncludedDocument[1] {%
105   \sc@enddoc@toks\expandafter{\the\sc@enddoc@toks#1}%
106 }

\includedoc Now we start from the other end, defining the user command.

\includedoc*
107 \newcommand\includedoc {%
108 % Robin's new:
109   \@ifstar {%
110     \def\sc@includebit@cmd{\include*}\sc@includebit
111   }{%
112     \let\sc@includebit@cmd\include\sc@includebit
113   }%
114 }
115
116 % My old:
117 %   {\sc@includebit}
118 %   {\clearpage
119 %   \sc@includebit[\clearpage]}}

```

\sc@includebit The commented-out code is for some eventual extensions.

Interface is `sc@includebit[⟨postlude⟩]{⟨file⟩}` (where [⟨postlude⟩] is command(s) to be executed after the inclusion is complete); it is assumed that `sc@includebit@cmd` is either `\include` or `include*`

```
120 \newcounter{sc@count}
121 \newcounter{bit}
122 \newcommand\sc@includebit [2] [] {%
123   \setcounter{sc@count}{\thebit}%
124   \begingroup
125     \DisableMonster
126     \let\usepackage\GobbleOM
127 % Robin's new:
128   \def\enddocument {%
129     \makeatletter
130     \the\sc@enddoc@toks
131     \sc@radical@shutdown@aftergroup
132   }%
133 % My old:
134 % \let\enddocument\sc@radical@shutdown@aftergroup
135   \let\documentclass\GobbleOM
136   \let\documentstyle\GobbleOM % why worry about branching if 2.09..
137   \def\document {%
138     \the\sc@begindoc@toks
139   }%
140   \def\IncludedJobname {\#2}%
141   \sc@includebit@cmd{\#2}%
142 \endgroup
143 \par
144 #1
145 }
```

\includedocskip Now we make a similar command that *entirely* skips the preamble, whereas `\includedoc` only skipped those commands that we specifically disabled. Obviously this whole business of the preamble needs to be radically reconceived if convenient modularity of documents is to be had. At the moment, no distinction is made between things like `\newcommand` and `\usepackage` that should be exported to a parent file, and those things that should not.

```
146 \newcommand\includedocskip {%
147   \@ifstar {%
148     \sc@includebitskip
149   }{%
150     \clearpage
151     \sc@includebitskip[\clearpage]
152   }%
153 }
```

I tried combining `\sc@includebitskip` and `\sc@includebit` but something changed when I used a conditional to do this. I'm sure the problem could be figured out and the two combined.

\sc@includebitskip We begin skipping with the \documentclass or \documentstyle command, and stop with the \begin{document} command. With some hacking to the new verbatim environment, this could be done. I haven't done this yet, so this is implemented by stuffing everything into a macro argument. I can't think of a \begin occurring between \documentclass the \begin document, but that will screw things up if it does.

The commented lines here are once again for a future extension.

```
154 \newcommand\sc@includebitskip [2] [] {%
155   \setcounter{sc@count}{\thebit}%
156   \begingroup
157     \DisableMonster
158     \let\enddocument\sc@radical@shutdown@aftergroup
159     \long\def\documentclass ##1\begin{%
160       \begingroup
161         \def\@currenvir{document}%
162         \GobbleM
163       }% "{document}" is still to be read.
164       \let\documentstyle\documentclass
165       \include*{#2}%
166     \endgroup
167     \par
168     #1\relax
169 }
```

Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
